Do you want to learn how to use hand-held Global Positioning Systems to improve your enjoyment of outdoor pursuits? Whether it be orienteering, hunting or mountain biking a GPS can increase your safety and improve your navigation.

The Royal School of Military Survey in the UK offers a one day course taught by the professionals who rely on GPS for life or death situations. This unique one day course will teach you the basics and explain the practical aspects of using GPS for navigation.

The next couse takes place in the UK on 7 February 1998 at the Royal School of Military Survey.

For full details see:

http://www.21store.com/mcacc/course.htm

See the pictures taken at our first course at:

4. Flexnet Ethernet Problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-01 00:00:00 UTC
From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <n9oEtHA1I$q0EwOM@peaksys.demon.co.uk>
Source record: 26275

I have a PC running a DOS packet program on top of Flexnet. It uses the Flexnet IPXPD driver to provide an ethernet channel. I have another system running Flexnet underneath Win95 with the ETHER32 driver.

The only way I can manage to connect to the DOS system from the Win95 system is if in the Win95 Network Configuration I set the frame time for IPX to Ethernet_II (the default is Auto).

That solves one problem but creates another - I cannot then connect from the Win95 system to my Novell 3.12 server unless I load a LAN driver on the server for Ethernet_II frame type (the default frame type for Novell 3.12 is 802.2). This all seems a bit complicated just to make it possible to connect one Flexnet system to another via ethernet! Am I missing something?

Sounds like RF getting back into things. Had that happen on an older 1278
that I bought a few years ago. Took some very creative grounding and RF
elimination rig-a-marole to fix it. Each setup is differant though so you
will have to start RF sniffing to see where it is comming in at and then
remedy it. Could be on the connecting cable between the tnc and the rig
for one thing, that may take some ferrite beads to stop. Also make sure
that the station ground is a good "RF" ground, not just a dc one. That is
one of the first places to look. (it was one of my problems at the time
although I found several others) Take heart though, it is fixable. I
think that I saw an RF sniffer project in one of the recent QST mags that
may be of some help to you. If you are not a member of ARRL you can go to
your local library usually and find the issues and copy the article.
Good luck with the RF sniffing and elemination.....

Hello, I am new to this and would like to start receiving cw on the HF bands, sending also. I have a old Radio Shack 1000 RL with no hard drive and a 8086 processor. I also have a 200 Pentium but would rather not like to use this if I can get around it. I tried the MFJ 1224 in my RV but it was just to much to mess with. know at home, a friend said to try the 1214, it would work with my old PC but I wouldn't get the fax option.
any help would be greatly appreciated.

It is dying in my area too, although APRS activity is UP!
Some of the problem is the Internet, it's faster but to me packet is FUN. Try
getting on APRS, 145.790. Monitor the freq for activity, there should
be some. Software links for APRS can be found at my web site.
A KPC3plus is around $120 by the way or you could get a used KPC3 for cheaper.

==========

For my two cents,

I always have like the simple yapp terminal program. beyond that I
liked TPK, TPK takes a little effort to get it to work with the FBB
header unproto broadcasts. TPK makes tranfers between a FBB bbses and
other TPK users a simple pull down menu operation. Most(many anyway)
of the terminal program are shareware or freeware, try them all out.

Isn't Ham radio just another (albeit somewhat unique) alternative for multifaceted communication modes that Hams have earned through the exam process, exercise through ingenuity, and keep based on legal behavior?

Thus it matters not which mode one chooses to use, for that is a very personal choice as to what is most convenient, enjoyable, and/or efficient.

I am personally looking forward to getting back on VHF packet and HF pactor in the near future (but using a Soundblaster board and a couple of different software options) ... as much for fun as convenience and/or effectiveness ... but then that's just my preference!

73 & Happy New Year! DavidC AA1FA

>>be using ham radio to do it.
>
>You missed the point. Actually you don't even concede there is anything

Oh, I don't think I missed the point at all. I think the point is
that you are suggesting that one doesn't really need _radio_ to do
packet radio.

>past a dumb terminal TNC. A dumb terminal TNC is "packet radio" all
>else is Godless, you imply.

I was running packet on a DRSI card nearly ten years ago. No TNC was
involved.

>Okay, I'll rewrite it in 6th grade terms.

[convoluted double-talk deleted]

>If this new "bbs" node wants to pop-up, and the other "bbs" doesn't
>want any competition, how the hell are they supposed to get their feed?
>Do they wait for a fricking satellite to pass overhead? Do they use HF?
>Now they have to put up an HF station, contact other sysops and get
>a feed. The chances of that are pretty slim. They could limit themselves

You've completed missed the point, but I suppose that's to be
expected.

>What you seem to be saying, is they want to emulate a node from 1985?
>That they don't want to expand technology. The reason packet radio

You can't "expand" without _starting_ somewhere.

>died, was that the dreamers got bored. Anytime anything new came on

That's part of it, but it's hardly unique to packet.

>frequency the mass protested--"That's not Ham Radio!", finally we have
>what we have today. Packet radio of the 80's. And another club wanting
>to fight about shit that doesn't matter. Put up the node. Maybe everyone

Nothing new or unique about this, either. Unlike things like DX
pileups and repeater wars, however, packet requires extended wide-area
cooperation, and that just doesn't seem to be possible. THAT'S why
people are leaving packet, not because of any inherent flaws with
using radios.

>will come over to you (everyone being about 5 people). Then you can
>build new 1200 links, and hell, why not throw in a couple of "netrom" or
>BPQ nodes! Technology from the 80's rules! Yawn...

You gotta walk before you can run. We put up a 2 meter 9600 baud
node. ONE PERSON uses it. Speed is NOT the current issue for the
average end user. Even at 9600 baud, the backbone is never
overloaded. There's no sense putting up a highspeed system if
nobody's going to use it, or if there's nothing to send over it.

>>Sigh. It's getting pretty bad when the wireline folks stop even
>>_pretending_ to use ham radio to build a network
>
>Until TAPR comes out with their 115k radio modem, I won't even consider
>RF for "networking." 1200 baud (10 cps) has been unable to attract and

My guess is that this alleged 115k modem won't make one damn bit of
difference to the demise of the RF portion of what's left of packet
radio. It's way to late for that, and Lockout Lids will still be just
as harmful at 115k as they are at 1200.

>build Ham Radio population. If we continue down this road, AT&T will

It attracted folks just fine. The problem was/is that there's been no
progress. Instead, the internecine fighting has pretty much ruined
even the 1200/9600 baud network, and the Internet has pretty much
killed off the HF net, I understand.

>own our bands anyway. If you don't grow, you die. Congress doesn't even

If you can't beat 'em, join 'em? You seem to be awfully eager to
defect before the battle's barely begun.

>consider Ham radio useful for national goals. Ask the Drug Czar, the
>Senate leaders, etc: "How are you planning to use the ARS to support
>National policies--policies like giving bored teens something to do."
>They will stare at you like you are speaking Boznian or something...

Nothing new or different about that. It's totally irrelevant to this
discussion.

Well here in Dutchess county N.Y. packet is dying fast. Regular BBS usage has dropped like a rock the past 2 years. One PBBS may be shut down soon because of inactivity. Not sure if it's like that in your area. The sysop just put up a APRS digi on our club repeater mountaintop. APRS is growing fast here. In Spetember I was the ONLY one on it up here. Now there's 6 of us (2 so far that I helped get on) and a few in the county south of here. I'm not sure what the problem is with the guys in yor area. I hope other respond, I'd be interested in hearing more opinions.

73,
Tom

Hello All,

Happy new year to you and thanks for reading this bulletin.

I am looking for a Winpack (Packet Radio Program) server that will read the data that is output from a Peetbros weather station, like the Ultimeter 2000 and then output the data onto packet in the form of a Unproto beacon or a command that you could give that would return the latest data received from the weather station or something like that.

I myself am not clever enough to write a server that would do this, but I am sure that some one is.

Hope that someone will be able to help me in my search for this type of Winpack server.

Hello All and Happy New Year!
I have an Icom 730 that I want to use on RTTY. The MFJ-1224 interface doesn't key the rig completely. I can hear the relay inside click,but it doesn't really go into transmit mode. I replaced the 2n3904 that is supposed to pull the PTT line from 13V to ground. It only pulls it to 6V instead. Is there any other NPN that I can substitute there to pull the PTT to ground? I even tried using the acc. plug in back,but no avail.
In the mean time, I can bump the TX switch and the mfj-1224 will hold it until the program says to go back to receive. Any help appreciated.
Thanks and have a great year!

Now ya see, that's the problem.

He's gotta call somebody a "Landline Lid." A personal attack, as opposed to honest disagreement.

"They can't get their stories straight." No "they" here, just my opinion as a user. I got tired of watching the sysops argue, it stopped being fun, so I stopped participating.

Regards,

Hi,

I have a 386 + DOS 6.21 + PK12 TNC.
I want to run packet without windows ('cause the 386 with windows is
soooo slow..).
Can anyone recommend a good software package to try?

Thanks.

Andy, G8YOA.

I like to use PAKET version 6.1 It does everything I like. Even
creates log files of the connects you do (it can be turned off)

remove the REMOVE.THIS from email addr...

Juergen,
I have a registered copy of HAMCOMM 3.1 and never have this problem on my laptop or desktop (both Pentiums). I occasionally get a little corruption at the bottom of the screen while transmitting, but it is transient. The outgoing text looks funny until it pops up to the next higher line. Even then, only occasionally.

While I haven't used mine under Linux (I run MkLinux anyway), I've had
no troubles under either DOS or Mac-OS and had heard nothing about
troubles of the firm-ware (although there have been updates since if was
first released)

I am using TNOS under Slackware 2. something with a PK-96 doing 9600 packet on a constant basis. My machine has been up for some 300 days with no problems. The Pk-96 works fine under kiss mode. I have never had it fall out of kiss mode at all. It has been a reliable controller for me.

34. MultiMode Decoder Software Version 0.9.0 Released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-02 00:00:00 UTC
From: cps@access.digex.net
Message-ID: <cps-ya02408000R0201981316490001@newsreader.digex.net>
Source record: 26298
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.digital.misc,rec.radio.scanner

I'm pleased to announce that version 0.9.0 of MultiMode, a digital modes decoder for the Macintosh, has been released. MultiMode uses the sound input feature of your Mac, and requires no external hardware.

MultiMode decodes the following modes:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
FAX
ACARS
WWVB Time Decode
DTMF
Audio Spectrum Display to aid in properly tuning in stations

Version 0.9.0 has several performance enhancements, and runs on Macs with the PPC processor, and possible some fast 680x0 machines.

A fully functional evaluation copy of MultiMode may be downloaded from the following URL:

http://www.access.digex.net/~cps/sss14.html

Help,

Does anyone know why I can send volume change commands to the 8500 @ 9600 baud and they work fine, but at 19200 they don't work. I can send freq change, etc at 19200 and they work fine, but if I send volume commands.... Well, it doesn't do anything except kinda screw up the serial interface on the radio, I sometimes have to turn it off and back on to wake back up the interface.

This is very odd, as I can send most other commands fine at 19200, infact I trunk track this radio at 19200, but I can't send it a volume change command at that baud.

All seems to work at 9600 however!

Any of you CI-V programmers out there??? Got any ideas?

Alan Adamson

My PK-96 has been running great since 1994. The AEA DSP-232 has not been as good to me. It got placed on the shelf fairly quickly. AEA shipped new EPROMs as part of their last act but I've not bothered to install them.

Ham Radios For Sale!
HF Equipment
I have a Kenwood TS-430S in like new condition. With mic and
internal filters! This rig also has the FM board in it for working
those great 10 Meter repeaters! It has a general coverage
receiver for listening to Military and Maritime traffic. It has been
professionally modified for MARS/CAP and WARC bands.

HF Equipment
I also have an automatic antenna tuner. It is a Kenwood AT-250
and is a matching set for the TS-430 listed above. This will tune
almost any antenna to work where ever you want it to. Also in
like new condition!

VHF All Mode!
I have an Icom IC-290H 25watt all-mode 2 meter rig. This is an
older rig but works great! This is one of the radios that was built
to last. It has FM, USB, LSB, and CW.

If you are interested please send me some E-Mail at the address below
and we can discuss pricing. Or check out my web site ad - the URL is
also listed below!

>
> The problem is getting into the command mode.

Your KAM could be in HOST or KISS mode. Turn the unit off and then
back on. If you see something like **S00* (but the * could be anything)
then the unit is in host mode. On a dos machine hold down the alt key
and type 1 9 2 on the grey keys. Let go of the alt key. Type Q.
repeat the ALT-192 sequence. This will take it out of HOST mode.

If it is in KISS mode try

hold ALT, press 1 9 2, release ALT
hold ALT, press 2 5 5, release ALT
hold ALT, press 1 9 2, release ALT

The 1 9 2 and 2 5 5 MUST be pressed using the grey keys.

If you're not using a dos machine you're going to have
to figure out how to send the binary sequence

C0 81 C0 to take the unit out of host mode
C0 FF C0 to take the unit out of kiss mode

50. FS: UHF Motorola Mitrek - 9600 BPS Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-03 00:00:00 UTC
From: Mike Murphree <n4cnw@mindspring.com>
Message-ID: <34AEBA7F.18A9AF2A@mindspring.com>
Source record: 26227
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.swap,atl.forsale

I have six Motorola Mitreks, model number T44JJA3000AK,
land mobile radios for sale. I will supply one standard Armadillo
connector (no cable) and trunk mounting plate with each radio.
I do not have channel elements for them. These units have a 50W
PA and cover the 450-470 MHz range (will operate in amateur
440 MHz band).

These radios are great for use as 9600 bps digital packet radios
with some simple modifications.

I want $65 for each radio plus shipping costs or will make arrangements
if you're in the Atlanta area. Payment must be prepaid by money order
or cashier's check.

Thanks,
Mike N4CNW

Jumper K6, in the KAM+ will perform a hard reset.

1. Remove power
2. Either open the top cover (new KAM+) or remove it from the box (old KAM+)
3. Place the jumper accross both pins at K6
4. Apply power to the modem and wait 5 seconds
5. Remove power
6. Remove the jumper and place it on *one* pin
7. Re-assemble the modem

Upon power-up, the modem will work as if it was turned-on for the first time (auto-baud, etc.)

PS. There are two "software resets" in the Kam Plus... " RESET <cr> " only resets ceratin parameters while the command " RESTORE DEFAULTS <cr> " performs the same as the hard reset. This is useful *if* you can talk to it !

You should at least buy a copy of their manuals... they are very informative and essential if you want to take full advantage of the modem.

Source record: 26229

I use a Sharp Zaurus ZR-5800fx in terminal emulation mode. I did need to buy their com port converter... but it works fine with a KPC3. I can "save to file", and I can print, using the IR port. The Zaurus is a pre Win-CE machine and uses proprietary O/S... but I use it in my travels overseas... I need e-mail, fax, word processing... and the Zaurus has it all in a palmtop (no foreign customs hassles, less of a target for robbers, etc).

You can find ZR-5000's for about $150. These were the first versions of the Zaurus series... their most recent incarnation is a monochrome or color Win-CE2 machine (and double the price of my ZR-5800fx).
Palmtops *seem* cheap... but once you add all of the options... they bring you to the $1k area.

Source record: 26230

I'm the chief-sysop of our club radio-BBS system here in southern California. We almost all of our network feeds off a 9600bps metrolink UHF network (still slow by European standards)... but I know that most of the traffic appearing there comes from wireline links.

My co-sysop team routinely deletes messages addressed to "sysop"... as they are mostly rantings of a few stubborn hams. Let's face it, our hobby is not attracting that much new blood. We have a *serious competitor* in the internet. I have been caught several times, showing the packet aspect of ham radio to prospective hams (who are computer/internet users)... only to display totally useless traffic and flame messages. A real turn-off for these people.

In Europe, they have been using 56k packet for several years now, and *experimenting* is still a plus.

We have to *stop bitching* about cross-platform messaging and accept it as a fact of technology. Ok... I have heard about the following argument : What happens in a national crisis when the PSTN is out ??? We need our radio backbone !!!
Hey guys, reality check !!! There exists a vast number of alternate paths (satcom, etc.) available. In addition, during such a major crisis, won't we be taking care of our families first ? I have a fully deployable packet station, laptop computer, ARES-data, transceiver, antenna and all, ready to be deployed in case of an emergency. When a *major* earthquake hits our region (SoCAL), I know that most of the packet repeaters will be off the air.

Packet usage in our area is also dropping... while APRS operations are increasing. This tends to prove that hams got bored with BBS systems... just like we abandoned dial-up BBS' for the Internet ones, hams are having fun experimenting with APRS. What's so special about APRS ? Nothing... but it's new and hams are playing with this more and more.

Packet-BBS systems are on the decline as internet usage increases... *we* need to be creative and introduce new challenges (such as high-speed HF data links... @2000bps+... it exists now in Europe with CLOVER-2000 modems. Our FCC doesn't permit it *yet*, due to bandwidth restrictions for HF data). The APRS balloon will burst and there needs to be something new.

Windows CE API's are currently only available from Microsoft -- See their Web Page. I bet you can't guess what compiler they work with can you . . .

Compiling for fun can be done by getting the 32bit version of GNU++ which works very well with Windows 95 and NT. You can find it on the Public Domain sites under the /pub/gnu/compiler directories. I think it's called DGG or something. It is entirely free for the downloading and using, but any software developed with it goes out under the GNU license. I remember Simtel, SUNET, funet, and some other having the directories. They are ftp sites.

Of note -- most software compiled with it is readily potable to unix/linux/free bsd/etc using the GNU compilers.

it.
>I run windows 95 but can run dos or windows 3.1 in need to for the bbs.

Generic BBS advice:

The "best, easiest" program will vary from place to place, but in every case
it will be whichever software the BBS stations you will be forwarding with
use themselves.

Use the same software and you will have an "Elmer" handy. (That's what
makes it easy, fast, and best)

It makes things easier for everybody, especially you. Before you do anything
else, introduce yourself to the SYSOPs you will be working with and get
Their opinion... That's the one that counts.

Good luck!

I like AMTOR and BAUDOT a lot. I've never tried ASCII. My best AMTOR contact was from south Texas to Djerbouti, in East Africa near the Red Sea. The name of the place reminded me of Frank Zappa's album "Sheik Yerbouti", and the the guy in east Africa and I ended up talking about music for 45 minutes. A fun QSO!
He was a Captain Beefheart fan, a rarity anywhere I'm sure. ;-)

>I get the feeling that you have some experiences with it -- including a lot

I probably would.

Unfortunately, the folks I refer to as "LandLine Lids" are not just a group who I disagree with. They are a group whose activities are aimed at destroying the global packet radio network. - And they have made some progress in this direction.

My tolerance for morons of that stripe is rather low...

Read the articles "Amateur Telephone - Personal Reflections", "Amateur Packet Radio's Malaise", and "Us and Them" in the ARTICLES section of my URL listed below for more details.

>I personally agree that the entire ham community is rampant with the
>doom-sayers. Maybe if they would all give up their licenses -- we could
get
>some cheap radios.

I doubt it. Most of the really negative types have all the moral rectitude of a snapping turtle. Don't count on them cutting their fellow hams any slack when they quit. After all, they couldn't manage it while they were hams.

>But, we ainta gonna doit with names. I seem to get the impression that
paket
>is growing into something else call APRS. I know nothing of it, but if
that is

>the way it goes, could we see to it that that is the way it grows?

APRS is a deal where you carry around a Global Positioning Reciever (GPS) unit which is hooked up to your TNC/Radio. Your position is reported and you show up on a map, along with the other guys with APRS.
As you can imagine, this system has great utility now and a lot of potential for the future.
It doesn't accept or deliver messages or bulletins, so APRS is unlikely to affect BBS operations. It doesn't accept or report DX spots, so APRS is unlikely to affect the Cluster stations much either.
APRS will probably serve best when storm-spotters utilize it, ect. It's cool, but it's not going to overshadow all other aspects of amateur packet radio, except perhaps within the imagination of an APRS enthusiast. - And that's how it ought to be.

>
>I'm probably one of your Landline Lids. Like I said -- doing it on a radio is
>way to much like work. I'm A-hole deep in the stuff all day long. If I
>couldn't download these messages and respond offline at leisure, I wouldn't
>even bother with this.

Packet radio is certainly not REQUIRED. If you don't enjoy it, try another aspect of ham radio out. There's a lot of diversity within amateur radio, and lots of enjoyable stuff to do.

>But, I'm always willing, abeit maybe slow, to learn new things. Maybe you
>could outline some positive growth trails for packet -- or what ever it will be
>in the future.

At this point your first step should be to identify and avoid supporting the negativity peddlers. Avoid TAPR and amateur tcp/ip altogether, and you will have eliminated over 70% of the total negativity which is presently going around. Maybe more.

You will hear reports of how negative I am... If you watch, you will notice that my negativity only applies to people who attempt to undermine and undercut amateur packet radio. In general, my negativity only applies to persons who think it's "OK" to use the telephone (Internet) in place of radios. In other words, I only go after the Non-Ham types who have no business participating in amateur radio in the first place. I make life tough for the people who are attempting to destroy the packet net, going after the current negativity at it's source.

Future of Packet? Well, the LandLine Lids have not managed to destroy packet radio in the US, but their negativity has managed to set back our progress by almost a decade now. To see the future of packet radio, take a good look at what is happening in Europe with the excellent FlexNet network right now. They are roughly ten years in advance of the US packet net.

There's an article with info on FlexNet in my page as well.

Enjoy!

Hello Dave,

I don't know which Kam you have, but the Kantronics Kam Plus has a
soft reset which is invoked by entering RESET.

The hard reset involves use of a jumper on the PC board, and I don't
feel very comfortable in telling you how to do something that would
reset everything to factory defaults when the owner of the unit may
not appreciate it.

Are you sure that you can't do what you need to do with the
soft RESET ?

The Ctrl-C should put you in the command mode and give you the cmd:
prompt, at which point you enter the RESET command.

When I toyed with APRS a few years back, I was able to send and receive
text messages -
so at least in the New England area APRS is more versatile in design (or
was).

Alan:

If you're running Win95, try going into your serial port advanced properties
and turn off the FIFO buffering. I don't own an 8500, but this worked for
me in similar situations.

68. Anyone Running Pactor With RiTTY & Soundblaster?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-04 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bd18b3$1722a140$0b8a92d0@bitnet.bit-net.com>
Source record: 26232

I understand there is a version of RiTTY DSP Pactor software that uses the DSP Soundblaster board.

Anyone out there running this successfully? Reports, please?

The $100. asking price is really reasonable, considering the cost of a DSP hardware solution!

Thanks in advance for any first-hand experiences, and/or references to a site that contains reports from users!

Hi All,
I'm looking for those Kenwood experts out there. I presently have an R-5000 receiver, and want to hook up my PK-232MBX and MFJ-784B DSP to it without using speaker jacks. Is it possible to utilize the remote DIN jack on the back of the R-5000 for use with the DSP and the TNC.If so, how can I do this. I do know that the purpose of the remote DIN connector on the rear is for the chance that I would be using the R5000 with another transceiver or transmitter, which is not the case here. I use the receiver only.
If someone could help me, I would really appreciate it.
Thanks,

Dave

> 73,

> Al WD5GNR

Hi Guys,

Well I have absolutely no problems as described , ** however ** the
frustrating thing I experience is the level of signal I require to get
"good" copy on RTTY . It has prevented me from being as involved with this
very good conversational mode as I would like to be.

I have the occasional QSO on RTTY and really enjoy it when 20 metres is open,
but need at least an S-3 signal to get all the info in readable format.
I use and old TS520S here , so probably signal-to-noise improvement would
make it better....maybe some kind of audio filter ??? recommendations
welcome. The computer is an old 386dx33 , which I purposely acquired to
enjoy HF digital modes. Using HAMCOMM 3.1 here, the software runs fine.

Hello Tom,

Yes it's disturbing how amateur packet radio is tearing itself apart, most disinterest by hams these days is due to all the ego-driven in-fighting and power mongering. I see it down here in VK , our local VK network is shrinking and people (users) turning away, not because it's slow, but because of all the politics and **hate**. I read the never-ending posts here featuring the usual cast all name-calling , and spitting on each-other, not a pretty advert for packet I don't think. Our network is choked not with useful technical & dx bulletins but similar vitriol of the same internecine kind, I don't blame guys for not spending $300 on a TNC so they can read "trash". Packet *MUST* serve a *purpose* for it to survive, how fast it is of secondary importance.

Being able to forward "mega-bytes" of mail via packet (or amprnet) is only worthwhile if it's of value to somebody, and I hate to say it... but it's mostly rubbish.

Tell me about this APRS stuff Tom, what's that all about ?

By the way you comment that to you packet is <"FUN"> , well that is something that most of the prize-fighters seem to have forgotten....
we all just do it for the **** FUN **** don't we ??

As a former very active digital ham on HF rtty/pactor and on VHF packet, it has even surprised me how little interest I have in any of the current technology.Years ago I tried to promote high speed local networks realizing how fast the technology was going to eclipse amateur radio if we didn't get moving. But there was not enough interest to even begin to reach critical mass in our area. You have to have that in order for this to succeed.

Also, there was extreme fanaticism on the part of only a few key people who greatly opposed the connection of amateur radio networks to the internet. They simply did not care that the current network was no longer useable for message handling with delays of as much as a week (sometimes never) destinating a message. Now we get upset if it takes more than 5 mins to anywhere in the world. The BBS ops seemed to me to be the most opposed to this since they somehow thought they would loose power.

I think I am being honest when I state that as a group the BBS ops often have an intense ego which is why they are willing to invest so much money and time into their sphere of influence. But it sadly colors their judgement, in my opinion, and makes it difficult for them to see the big picture and the long term effect which they are now seeing as a result.

Amateur radio should have been able to have reasonably high speed local links and a reliable mail system as the minimum since our technology would meld so well with the internet technology and yet do something that most people still can't do and won't for some time (wireless access).

But sadly, it is not going to happen.

>kind,

That's a lie. If you objectively look at the message base of any packet
BBS, you will find that information bulletins and sale/want postings make up
the bulk of the traffic there. By a wide margin.

Only the socially retarded would suggest that discussion of issues be halted
or limited because the participants disagree with each other and differing
opinions freely circulate.
Usually it's a LandLine Lid who you will find trying to limit other ham's
ability to freely debate and discuss issues related to packet radio. Most of
them strike me as low-rent pocket nazis who would just LOVE to be able to
limit everyone else's activities. They couldn't be more obvious if they had
JERK stencilled across their foreheads.

I don't think you are stupid enough to really believe your own lies.. I think you "stretched things" in order to support a weak point. You lied in order to support your negativity. A proud moment for amateur radio, I'm sure.

>I don't blame guys for not spending $300 on a TNC so they can read
>"trash". Packet *MUST* serve a *purpose* for it to survive, how fast it is

And there is the negativity you were so dishonestly leading up to.

>
>Being able to forward "mega-bytes" of mail via packet (or amprnet) is
only
>worthwhile if it's of value to somebody, and I hate to say it... but it's
>mostly rubbish.

Oh, that explains it. You're another "Amateur Telephone" advocate. By the way, amprnet doesn't move megabytes of anything, as you know. The Internet and other non-ham links you must utilize in order to prop up your essentially non-ham software and "networking" philosophy is NOT amateur radio, or even amprnet.

I give credit - when it's due. Amprnet does not exist on anything than a very limited, localized scale. There is no global amprnet, or even national amprnet. Why pretend otherwise? Amateur tcp/ip is a parasite which would quickly wither and die if it could not feed off of other, more legitimate networks such as Amateur Packet Radio and the Internet. In return for the blood amateur tcp/ip sucks, they return - nothing. Absolutely nothing is offered to those networks in return.

It doesn't have to be that way, of course, but it is.

You can start by going to the father of APRS' site:
http://web.usna.navy.mil/~bruninga/aprs.html

Send a note to the APRS SIG e-mail list and ask for the info on how to subscribe. I have forgotten the address and command.
The address is: aprssig@tapr.org

You'll get plenty of help!

Hope to see you on the map!

73,
Tom

TAPR has a mailing list for the APRS Special Interest Group.

To subscribe to this mailing list send a message to `listserv@tapr.org`
with the following line in the body of the message:

subscribe list full_name

Example:
subscribe aprssig FirstName LastName

There is also much APRS information at TAPR's web site (http://www.tapr.org)

It's probably to do with the serial port FIFO buffer.
I think you can switch this off in Windows '95, but
not sure how.

Do you really need that sort of speed?

All the best for 1998.

Paul,

You really need filtering -- makes a big difference. I used to use a simple state variable opamp filter, but now I have DSP in the radio. I could probably scare up the schematic if you like, but any filter will do.

Is there anyway that you capture to a file, a Real Audio Stream, such as Amateur Radio Newsline has available on their home page for weekly download broadcast?

I do not want to record it on an external tape player but to a wave file for future use. The audio stream online download works fine but it is susceptible to stopping/starting delays based on Internet loading.

Hello,

I always wondered why the BBS sysops spend so much resources to keep a
BBS operational. In my experiance it hasn't been the BBS operators
ego's that hinder the improvement of the local networks. I found it to
be the rufusal of the end users to invest into the infastructure. When
those of us who would like to improve the sytem approach the other
packet op's for a little assistance. More likely than not the reply is,
if the bbses didn't carry x,y,z(enter your most hated bulletin subject
matter) bulletins, the system would have plenty capacity.

LandLine Lid Rick Williams wrote in message
<01bd193a$c40fa880$98a182d1@rwilliam>...

I have pointed out some of the more common behavioral quirks common to
LandLine Lids before, but this one here fits the stereotype SO WELL that I'm
considering giving his posting immortality, making Rick the "LandLine Lid
poster boy" for an article I'm currently working on.

Check it out!

>As a former very active digital ham on HF rtty/pactor and on VHF packet, it
>has even surprised me how little interest I have in any of the current
>technology.

No longer really a participant in amateur packet radio, but feels qualified
to complain.

Packet radio is not "high tech" enough for him. Only the telephone can
satisfy him (as a ham??).

>Years ago I tried to promote high speed local networks
>realizing how fast the technology was going to eclipse amateur radio if we
>didn't get moving.

3. Tells us what he USED to do.

4. Concerned that technology would leave packert radio behind, despite the
fact that packet radio NEVER WAS ahead of the current technology.

>But there was not enough interest to even begin to reach
>critical mass in our area. You have to have that in order for this to
>succeed.

5. Realizes that almost nobody in his area wanted or liked tcp/ip, but
didn't get the hint.

>Also, there was extreme fanaticism on the part of only a few key people who
>greatly opposed the connection of amateur radio networks to the internet.

Those pesky Ham Radio Operators, and their silly insistence upon using
Radios!

>They simply did not care that the current network was no longer useable for
>message handling with delays of as much as a week (sometimes never)
>destinating a message. Now we get upset if it takes more than 5 mins to
>anywhere in the world.

Rick says the Ham Radio digital net is too slow. His way to advance our amateur radio technology ? Use the phone.instead!

Like most LandLine Lids, Rick is a real "ham among hams", huh? A real innovator.

>The BBS ops seemed to me to be the most opposed to
>this since they somehow thought they would loose power.

Hey, where's all this "power" I'm supposed to be afraid to lose?

BBS SYSOPs oppose Amateur Telephone for the same reason that any sane ham would. - The telephone quite simply IS NOT amateur radio, and each time the telephone is used to route around the existing ham digital network, that network suffers.

Most rational hams understand that utilizing non-ham communication in preference to ham radio within our packet net can only damage that packet radio net.

Use radios, BOZO, and BBS SYSOPs (and other hams) will have no problem with what you are doing at all.

Your current behaviour (insisting upon using the telephone and "pretending" it is amateur radio) is a littl;e too ignorant and short-sighted for most hams to tolerate, particularly BBS SYSOPs who were (and are) instrumental in BUILDING that ham digital network.

Of course BBS SYSOPs feel a sense of responsibility. Too bad LandLine Lids don't.

>
>I think I am being honest when I state that as a group the BBS ops often
>have an intense ego which is why they are willing to invest so much money
>and time into their sphere of influence.

Let's see... You don't like the packet network, think it's too old and slow, and really prefer to use the telephone anyway.... Now just what is it about the ham digital BBS net that you are frustrated in doing? Destroying it?

Aw, I think I'm gonna cry!

And don't forget to criticize BBS SYSOPs for investing their time and money into building the packet network.

Moron.

> But it sadly >being hams< colors their
>judgement, in my opinion, and makes it difficult for them to see the big
>picture and the long term effect which they are now seeing as a result.

Gee, if hams keep using radios, we could end up in real trouble! According to poster boy Rick.

Rick thinks that over the long run, we'd all be better off (as hams) using telephones.

>
>Amateur radio should have been able to have reasonably high speed local
>links and a reliable mail system as the minimum since our technology would
>meld so well with the internet technology and yet do something that most
>people still can't do and won't for some time (wireless access).

Got news for you, BOZO. A member of my family is currently building a
wireless access net for a large communications carrier. Spread-spectrum,
56kbd, cellular with over 200 customers at this point.

Been there, done that. My relative, unlike you and your buddies who DREAM of
doing that sort of thing, understands that hams should have their own
network.

Why can't you?

>But sadly, it is not going to happen.

Haw Hawr! You said it, Bub! Not with "Amateur Telephone", at any rate.

What should they offer? A continuation of what they are trying to replace? That would be futile. TCPIP would then fail, because TCPIP requires work, work that some are afraid of, and if given a alternative, will completely ignore for a simple plug and play BBS solution, if BBS services are available. That is not advancement, but a step backwards. TCPIP'ers realize the only way to advancement in a welfare system is to move the welfare to TCPIP welfare.

Hey Charles,

You're a nice guy aren't you! I would tentatively suggest that the vitriolic comments in your messages are of the same sort of which people complain in packet networks worldwide.
YES people have different views, but they should discuss them RATIONALLY, SENSIBLY, and without taking things personally.

I queried the use of the UK packet 'network' by a couple of individuals for their own slanging match using @GBR bulletins. In reply, I got near 40 messages of support, and a rude message from one of the supporters, in which he pointed out spelling mistakes and called me a boring old f*rt. He obviously didn't know I'm 17!

Packet WILL die unless we keep up with technology. Who, after experiencing 56k6 internet access can cope with 1200baud access to a BBS? I run exclusively TCP/IP in a regional network with likeminded friends here in SW England. We want to keep up with technology as much as possible - the only things stopping us are the 'not-true-amateur-radio' brigade, and those who think that 9600baud+ is still experimental!!

And after experiencing tcp/ip over packet, who want to go back to BBS mail? Not I!

73! Duncan.

Network Resources. Radio links. Services. - All accomplished through use of Amateur Radio. (For the sake of being relevant to an Amateur Radio digital network.)

> A continuation of what they are trying to replace? That would be futile.

I agree.

TCPIP cannot provide global messaging via amateur radio, as the Ham digital net does every day.

TCPIP cannot provide the above on a continental scale, or a national one, or even a state-wide one unless your state is awfully darned tiny. It doesn't do any of those things at ANY speed, using radios.

No competition there. No relevance to global amateur digital radio there. You're entirely right, David.

>TCPIP would then fail, because TCPIP requires work, work that
>some are afraid of, and if given a alternative, will completely ignore for
a
>simple plug and play BBS solution, if BBS services are available.

Again, I can only agree. Amateur Radio TCPIP needs a LOT of work. Hard work that TCPIP users have shown no inclination whatsoever to do. That's why there is no Global, National, or even Regional amprnet. Just piddling local stuff. Fast, but extremely limited and isolated. Much ado about nothing, as far as being an amateur packet radio networking solution goes. It's a big world out there, and amateur TCPIP just can't hack it as a way to build a large-scale RF network to fit that world.

Rather than make a serious attempt to rise to the many challenges of amateur radio, the familiar telephone is resorted to instead...

>That is not advancement, but a step backwards.

You said it, brother! Please stop.

>TCPIP'ers realize the only way to advancement in a welfare system is to move the welfare to TCPIP welfare.

Hams consider the "welfare" of Amateur Radio in general, and their fellow hams in particular to be more important than TCPIP "welfare", BBS "welfare", or whatever. When TCPIP'ers realize THIS, they will be taking their first serious steps to achieving relevance within the amateur radio community, and thus being capable of making a worthwhile contribution.

Get with the program. Get your priorities straight. Then proceed. As a Ham.

Network resources are easily supplied when a protocol standard capable of
dealing with anything is used as the basis. Everyone's system gets along,
everyone is happy.

And why not? Simply because it isn't that widespread as a long distance
communications methodology or do you think TCPIP isn't capable? The widespread
use problem is slowly being corrected, and the capability question doesn't even
require an answer, everyone knows the protocol is capable, for you to imply it
isn't based on it non-proliferation for long distance links is reason based on
the wrong facts, and only faulty reasoning can result, as it clearly has.

> TCPIP cannot provide the above on a continental scale, or a national one, or

>

Why not? I don't see why you are heaping TCPIP in along with wirelines. TCPIP
was never meant to only be a wired service, contrary to what you may believe.
Get your facts straight, and then come back and talk to me.

> Again, I can only agree. Amateur Radio TCPIP needs a LOT of work. Hard work

>

Its been the Phil Karn's of radio land that HAVE written software, that HAVE designed systems. I don't think you realize the very people who you insult have been the very people who contributed the most work. Where is your logic?

As to your faulty hypothesis that TCPIP can't be used to build a world wide net, I say you are wrong again. Where is your basis? And even worse, when TCPIP really begins to take hold in those high speed foreign networks and starts to spread here, I guess you will be out in your war paint against that, too, right? Seems statistically viable given your current unreasoned stance on the matter at hand.

> Rather than make a serious attempt to rise to the many challenges of amateur
> radio, the familiar telephone is resorted to instead...
>

And then you drop to a mere attack on those who choose to resolve themselves to using the telephone network to patch together amprnet, and further imply that all TCPIP'ers do the same thing. Do you have facts to prove this?

> >That is not advancement, but a step backwards.
>
> You said it, brother! Please stop.
>

The only thing that is a step backwards is your resolve to remove the possibility of TCPIP from amateur radio land like its some kind of disease, and doing so by mentioning just 1 or 2 networks that model what you call bad radio networking behaviour. I just don't get it, and I guess I never will. You have been given chance and chance again to give us these reasons, and yet you have failed each and everytime and have instead lowered yourself to hurling emotional diatribes about the social welfare of the HAM community.

> >TCPIP'ers realize the only way to advancement in a welfare system is to

> thus being capable of making a worthwhile contribution.
>

Come on, quit trying to screw with our minds with that line. Sure most hams do have some sort of respect for each other, but for the most part, the people who paid the money like to call the shots, to heck with welfare for each other. Aren't you the one that said we have to work with the system we have? Well, TCPIP'ers attempt to. We are forced into a system that where might makes right or in this case the standard. After enough might is exerted, the old systems pass away, and everyone is forced to try new stuff, our stuff. While I do not endorse relying solely on telephone networks to patch together radio networks, it is just one group's means to an end to accomplish a transformation to a new protocol, at least thats how I perceive it. You have already told us you don't see it that way, so don't bother grinding it out again for us with your typical

name calling embedded here and there.

And if you actually were concerned about your fellow ham anyway, you'd understand not all of them like playing with your little BBSs, they like REAL networks. Don't confuse REAL network with a installed infrastructure. I realize that there is not a huge TCPIP infrastructure, but that doesn't restrict it from being a true network. BBSs have a huge infrastructure, but they are not true networks. The only shared resource that is worth using over long distance through a BBS "network" (joke, HAR!) is slow, unreliable email. So when it comes down to community service, its really not even reliable enough for that sort of use.

> Get with the program. Get your priorities straight. Then proceed. As a Ham.

I am a HAM. I've got my liscense to prove it. You see, the FCC determines whether I am a HAM or not, not Charles Brabham, thank goodness! Don't even bother telling me if I am a HAM or not. I know good and well who gives me that authority, and last I remember, it wasn't you. I have no respect for people who even would dare to make such comments, as if you define the HAM standard. I guess we will be taking the FCC endorsed Brabham Amatuer Service entry exam?

Certainly not. Mac programmers can't be bothered with such lower
life-forms as Wintel peecees. ;)

Try Radioraft. Does the same and then some more. Have a look at
http://ourworld.compuserve.com/homepages/f6flt

(blush) Why, thank you, Duncan! What a nice thing to say!

>I would tentatively suggest that the
>vitriolic comments in your messages are of the same sort of which
>people complain in packet networks worldwide.

No doubt. They manage to complain about other sorts of comments as well. So? If I complain about your self-righteous attitude, does that mean that you should then be silenced? -- Or should you then be free to respond or not, as you please? Hmmmm? Think it through carefully.

I complain sometimes about "whiners".. You know.. - The ones who love to get up on their high-horse and pretend to be morally superior? Many of these tend to promote limited, moderated, and highly structured discussions, such as can be found at TAPR's SIGS. They must not like it too much though, since the TAPR SIGS are mainly dead.
Most of these advocates of limited discussion, naturally, tend to come from the losing end of the debate.

>YES people have different views, but they should discuss them
>RATIONALLY, SENSIBLY, and without taking things personally.

That sounds fine with me. Have you taken something said here personally? If so, the rational, sensible thing to do would be to avoid complaining about it, knowing that (by YOUR standards) your complaint has no relevance to this discussion.

Don't presume to tell me what I do or don't take personally. I doubt if anyone else will appreciate your opinion in that area either. Stick with things you have a clue about, and you'll go far.

>I queried the use of the UK packet 'network' by a couple of

>reply, I got near 40 messages of support, and a rude message from
>one of the supporters, in which he pointed out spelling mistakes
>and called me a boring old f*rt. He obviously didn't know I'm 17!

Your self-important and unimaginative attitude probably fooled the individual. Also, it must be admitted that the great majority of outraged censoship advocates are, in fact, boring old f*rts. You fit the profile, and he made a pretty good call. The unusual thing about the situation is that your attitudes have drifted into such an awful rut at such an early age. Most guys save all that for when they get to the "doddering old fool" era, much later on in life.
What's your hurry?

>
>Packet WILL die unless we keep up with technology. Who, after
>experiencing 56k6 internet access can cope with 1200baud access
>to a BBS?

The ones who don't want to pony up for faster equipment, I suppose. (And that's just about everybody, sad to say.) I've had 9.6kb stuff available on my node/BBS system for over five years now, and have yet to see my first packet contact at 9.6kb. It's the same story with the local amprnet, so don't get on another high-horse about high-speed. In fact, there are many more high-speed links in my area associated with BBS forwarding and Network links than there are with TCPIP.

>I run exclusively TCP/IP in a regional network with
>likeminded friends here in SW England. We want to keep up with
>technology as much as possible - the only things stopping us are
>the 'not-true-amateur-radio' brigade, and those who think that
>9600baud+ is still experimental!!

I doubt that anything is "stopping" you at all. If what you have to offer is REALLY better, and not just better in fantasy-land, the great majority of hams will soon be using what you have to offer. If not....

I think that TCPIP has been pretty ineptly handled within the amateur radio community, but have nothing against TCPIP itself. I use it every day. It's great, ain't it?

>And after experiencing tcp/ip over packet, who want to go back to
>BBS mail?

Probably those hams who want to send and recieve E-mail and bulletins via digital amateur radio.

TCPIP cannot offer that. If you communicate with a distant ham via amprnet, the bulk of the distance covered will be via the Internet, not amateur radio. This applies to E-mail, conferences, and the moronic practice of "DXing" distant packet BBS stations via Internet links. None of these are amateur radio activities. The tail wags the dog.

Any clown can do E-mail via the Internet. Only a Ham can do it globally via amateur radio.

>Not I!

Sorry to hear that, OM, young man. Whatever.

I can never understand why people seem so obsessed with comparing packet
and the internet. Could you ever imagine a bunch of anglers (fishermen)
comparing the fun and challenge of catching a trout with buying a frozen
one from the supermarket?

Packet is part of amateur radio, as such it doesn't have to compete with
the internet - because the internet isn't part of amateur radio! If you
can't see that point, then I think you need to ask yourself what your
hobby really is.

>several occasions ... BECAUSE YOU ACT LIKE ONE SO DAMNED CONSISTENTLY.

Squiggy, Squiggy, Squiggy. You haven't restricted the 'calling' to Mike.
You call EVERYBODY who doesn't fit into your mold of the perfect
beeperless electronics engineer the same thing. You have a deep down
hatred for ham radio and everything it stands for. You need help, bubba.

>At least I had a REASON ...

No, you have two reasons. One, because you're you. Two, because you are
obsessed with this code/nocode baloney to the point where it has become
the most important thing in your life.

>That is WORLDS different that attacking a foreigner for whom English
>is a second language for some silly grammatical mistakes just so you
>can take a cheap shot ... one has to wonder if you would attack "Masa"
>so vigorously if he were a) not Japanese and b) not in favor of the

>you and Jim Kehler are amongst the worst examples of "Ugly Americanism"
>that I have EVER seen. (And I saw some AWFULLY rude and ignorant gringos
>while I lived in Mexico ...)

Our friend Masa is the town clown, the local jerk, the fool - if we teach him
a few more bad words in English, he may even become world class, like you.
Masa would still be the town clown if he could copy Morse code at 50 wpm.
He enjoys playing the fool - the difference between you and Masa is he
realizes he's a fool. You could turn a church sermon into a no code debate,
Squiggy.

You aren't interested in ham radio - you are only interested in making noise.

You are bitter because you haven't gotten anything out of ham radio because
you haven't put anything in to it. You are very confused.

Let's look at a few things you have said recently:

First, you told somebody:

>Message-ID: <01bd10ca$2914a920$0100005a@wa6vse>

>Yeah ... join No Code International (http://www.nocode.org) rather than
>sending your money to Oldington so they can use it to lobby AGAINST your
>interests and keep ham radio stagnated in the past.

Then you turn around and say:

>Message-ID: <01bd0f4c$55535e20$0100005a@wa6vse>

>I've been a dues-paying member of the ARRL since at least 1975, with only a
>brief lapse in membership while I was out of the country and didn't get a
>renewal notice.

So what is it Sqiggy, are you suffering from a split personality, or are you paying the ARRL 'to lobby AGAINST your interests' one day and then advising somebody else NOT to do the same the next day?

I guess the ARRL is OK for you but not for anybody else. Kinda like CW tests are OK for me but not for you, right ?

Kinda looks to me like you are playing both sides of the fence here Squiggy, and hoping the fence will cave in......

Before you bother to spend an hour trying to type out some explaination for the above, remeber that you you also said:

>Message-ID: <01bd1924$82019220$0100005a@wa6vse>

>The ARRL is ham radio's worst enemy.

>they are just a bunch of mealy-mouthed, weasle-worded
>politicians ... comparable in ethics and credibility to Bill Clinton,
>who is unquestionably the most corrupt, scumbag president since LBJ.

The ARRL is ham radio's worst enemy.... so you have been sending them money for 22 years to support the cause - your REAL cause - you want ham radio to go away. Mealy mouthed, weasle-worded politicians, whom you have supported for the last 22 years by sending them money.....

I don't think you are a hundred percent correct in that last quote, Squiggy. I think people like YOU are ham radios worst enemy. You're like the 4 year old kid whose ice cream fell on the floor - first thing you want to do is grab the other kids ice cream and throw it on the floor - if you can't have any, then you

don't want anybody else to have any either.

You have been a technician class ham radio operator for 25+ years. Nothing about ham radio ever excited you, intrigued you, got you interested. But you did notice along the way that other people in ham radio were having a lot more 'fun' than you were, and that pissed you off.

So then along came the no code tech license, no code international, usenet, and there you were, pissed off, just waiting to jump on the band wagon and see if you could help flush the toilet. You always wanted to be a HERO instead of a ZERO, so here you are typing, in hopes of confusing the sheep.

You have ZERO excuse for being a tech, Squiggy. You have expounded many times in the last two years how much you know about electronics. And a few times you have even slipped up and said:

>Message-ID: <01bd187c$5c2853c0$0100005a@wa6vse>

>I know (and passed a test on) the code ... I'm not as fast as the High Priests
>of Morseodism in Oldington and others like Roll, Carroll, etc. would like to
>see as "The Standard of Excellence," but I could copy CQ at probably 40 wpm ...

Which really blows a big hole in your 'I wanna get on HF to do digital experimentation and bring ham radio into the 21st' century but the code test is keeping me off HF' baloney. If you can copy a CQ at 40 wpm, you can damn sure pass a 13 WPM code test and get on HF and do all the experimenting you want - but that's not the real agenda - your real agenda is to cause as much hate and discontent as possible and see if you help throw the ice cream on the floor.

You're a fraud, Squiggy. A fake. Sad thing is, you have worked yourself up into such a rage and you spend so much time slobbering over a keyboard, that you are about the only one left here that doesn't realize that. You need help. Professional help.

You are not interested in ham radio - you are only interested in making noise.

But I'll tell you what I am going to do. ARRL membership now, I think is $36 a year. I have no idea what it was 22 years ago, so I will use todays figure. $36 times 22 years is about $792. We'll round if off to $800.

I'm going to give you a refund, so you can have back everything you have put into ham radio. You throw away the usenet software and go find a good head doctor.

You explain to him that you are consumed by the fact that you hate ham radio, and ask him if he can give you some help. If he says yes, you tell him to send me the bill for the first $800 worth. I'll look at it as my investment in the future of ham radio......

I've noticed you seem to have a problem finding things I post in usenet lately, Squiggy, so I'll email you a copy of this to make sure you get it. My usenet feed just isn't that reliable, I guess.

I have programmed interfaces for both the PRO-2035 w/opto and the R7000.
The problem you are having sounds like an ICOM firmware "feature" :(The
ICOM 8500 probably can not handle the frequency of volume change
commands you are sending it at 19200. I assume that the volume moves in
discrete steps, having never programmed CI-V for the R8500. If this is
the case, try sending one discrete volume change, at 19200, and see what
happens. If your 8500 does not lock up then you have to code your
interface to take this timing into account. I like to use event
programming when designing my intrefaces that way I can use the
response, if one is given, to trigger the next action. This somewhat
syncs the communication between the radio and the PC. The gist of all
this event programming is that you will not get ahead of yourself and
overdrive the CI-V interface.

Let me know if any of this helps

For most people the hobby is communicating with other people. This is
now possible even when people are far away from each other. Look at
the popularity of telephone chat lines, cellular phones, the internet,
CB and amateur radio (e.g. the all day long nets on 80 m). For these
people, they just pick case by case the most suitable medium. For
licensed radio amateurs to communicate with other licensed radio
amateurs, amateur radio is often the most suitable means of
communication. However, the same persons may still communicate with
each other with different means of communication (such as phone, fax
or internet) in different situations without feeling guilty. For them,
the communication is more important than the medium.

In amateur radio it is also possible to do a lot of experimentation,
such as experimenting with circuits, antennas, protocols (in the broad
sense) etc., but unfortunately only a small minority of licensed
amateurs are interested in these kind of activities.

If we are going to define amateur radio with a narrow, purist
attitude, there is not going to be much people left to maintain a
vivid community.

No, because the people who tend to be attracted to TCPIP are not capable.
Look at what they've done in the last decade+ (nothing) while other hams
went on to build a global network using protocols more suitable to amateur
packet radio. Amateur TCPIP is a joke, OM, and the funniest part of all are
the clowns who rave about "progress" but whose "contribution" appears to be
limited to blowing hot air about amateur TCPIP services which hams have
shown over and over to have absolutely no interest in (as part of amateur
packet radio).

Whew! And they call that grammar? Try to calm down, OM. Most of us find
that we can communicate better when our sentences make sense.

When you can craft a sentence which makes sense, come back and make another
attempt to fault my reasoning. Maybe it will go over better on another try.

HAVE
>designed systems. I don't think you realize the very people who you insult
have
>been the very people who contributed the most work. Where is your logic?

Phil Karn wrote NOS. Later he went on to promote "Amateur Telephone", the
problem you wouldn't admit the existence of a few paragraphs back...
Remember?

--

Phil Karn KA9Q (Author of NOS) in response to my statement on the tcp-group SIG concerning:

Subject: Re: 2300 MHz band reallocated

N5PVL:
Many *NOS stations are now set up for the single purpose of misusing Internet as a cheap, dumb way to avoid the use of radios. Internet message forwarders are the best known example of this.

We can't really afford that type of stupidity any more, IMHO.

KA9Q::
Why is this stupid? Many people outside ham radio would consider it more stupid to build a radio network that uses precious spectrum instead of using existing fiber facilities with much greater capacity and lower cost.

I feel that radio spectrum is too valuable to waste on point-to-point links that are better implemented with non-radio facilities.

Here Phil tells it as he sees it.. The global amateur radio digital network is a "waste of spectrum". He seems to share Greg Jone's belief that we would all be better off (as hams?) using the telephone, and sees nothing wrong with activities which tend to damage the existing network, such as Internet Forwarding is proven to do..

I can see where Phil would be interested in the opinions of those who are "outside of ham radio".. Sounds like that's where he's coming from himself!

Unfortunately, many Amateur TCP/IP enthusiasts have been exposed to Phil's thinking for years and mindlessly parrot variations on this line of propaganda at every opportunity. This is one of the main sources of the the present disdain for the packet radio network as expressed by many *NOS users.

*NOS users, by the way, are the folks who set up the Internet Forwarding gates which are currently destroying the amateur radio digital network by systematically "routing around" the existing radio links with the telephone. These same hams constantly disparage the packet BBS store 'n forward network, but insist on being a "part" of it for the sole purpose of destroying it from within.

My feeling is that if Phil Karn's followers do not like the packet radio network and want to do something different, there is certainly nothing wrong with them doing so.

This does not mean that it is acceptable for them to engage in activities designed to damage or destroy the packet radio network. One central tenet of amateur radio is that hams should avoid activities which will tend to lessen the enjoyment of other hams. Phil Karn's followers violate this rule of behaviour every day, as they attempt to dismantle and destroy the amateur packet radio network which was built through the cooperative efforts of countless hams around the world. This behaviour is simply not acceptable -

Among hams.

If Amateur TCP/IP (NOS) can only work if the radio network is destroyed and replaced by telephone links, then as hams we can do just fine without TCP/IP.

>
>As to your faulty hypothesis that TCPIP can't be used to build a world wide net,
>I say you are wrong again.

Ok, where's your global RF net? You've had the same amount of time the real hams had. Where is it?

>Where is your basis?

See the above.

>And even worse, when TCPIP
>really begins to take hold in those high speed foreign networks and starts to

>>
>
>The only thing that is a step backwards is your resolve to remove the
>possibility of TCPIP from amateur radio land like its some kind of disease,

and
>doing so by mentioning just 1 or 2 networks that model what you call bad
radio
>networking behaviour.

I have never suggested that TCPIP be removed from radio land, as you put it. I've said we could do without it on many occasions, though, and I'll probably mention that fact a few more times.

TCPIP has potential for local nets, but has proven to be really useless for long-haul stuff with radios. The central problem here, of course, is that TCPIP really SUCKS unless you have a high-speed link. AND there is currently no way to provide those high-speed links on a wide (national, global) scale via Radio.

So we use what works instead. Sorry, but that's how it is OM.

> I just don't get it, and I guess I never will.

Many of us noticed that some time ago.

>You have
>been given chance and chance again to give us these reasons, and yet you
have
>failed each and everytime and have instead lowered yourself to hurling
emotional
>diatribes about the social welfare of the HAM community.

"Reasons"? You tell me I've been given "chance after chance", and again your poor grammar makes it hard to follow your alleged train of thought. A good idea, right before that sentence, would have been to give a clue about what "reasons" you are blathering about.

Yes, I know that you hate to be reminded of the fact that you are not the world's only ham, and that all those other hams are just as important as you are. I know it bothers you be reminded that you have a responsibility to those other hams, and that yes, your behaviour DOES matter. When I mention these things, I'm sure that YOU feel quite emotional, but in my case I'm just pointing out a simple fact.

>> >TCPIP'ers realize the only way to advancement in a welfare system is to
>> move the welfare to TCPIP welfare.
>>
>> Hams consider the "welfare" of Amateur Radio in general, and their fellow
>> hams in particular to be more important than TCPIP "welfare", BBS
"welfare",
>> or whatever. When TCPIP'ers realize THIS, they will be taking their first
>> serious steps to achieving relevance within the amateur radio community,
and
>> thus being capable of making a worthwhile contribution.
>>
>
>Come on, quit trying to screw with our minds with that line. Sure most hams

do
>have some sort of respect for each other, but for the most part, the people
who
>paid the money like to call the shots, to heck with welfare for each other.

In the TCPIP community, perhaps. The amateur radio community has a long-standing tradition of fellowship, decency and courtesy which appears to have been too socially advanced for you and many of your TCPIP peers to comprehend. In the past, most hams were generally civilized and had no trouble understanding and living with these concepts. - That was before the bitter negativity and moronic insistence upon non-cooperation we as hams have had to endure from the isolated, insulated amateur TCPIP community.

>Aren't you the one that said we have to work with the system we have? Well,
>TCPIP'ers attempt to.

That's a rather poor, obvious lie. You're starting to look almost as incoherent as Steve Sampson.

>We are forced into a system that where might makes right
>or in this case the standard.

No, actually right makes right. --- Except to amateur TCPIP goons.

>After enough might is exerted, the old systems
>pass away, and everyone is forced to try new stuff, our stuff.

Oh, I'm scared!

>While I do not
>endorse relying solely on telephone networks to patch together radio
networks,
>it is just one group's means to an end to accomplish a transformation to a
new
>protocol, at least thats how I perceive it.

Poor sod. I wouldn't admit it if I were that stupid. Well, if I were really that stupid, maybe I would.

Do you know what a Packet/Internet gateway is? Do you know what they do? Hmmm?

Quit pretending to be even more ignorant than you really are. Everybody sees what you're doing. Folks who are desperate because they are losing the debate often do that, and we're all familiar with it. Don't waste your (and our) time with any more of that stupidity, please. If you realize you have lost the debate, be a man about it, OK?

>You have already told us you don't

typical
>name calling embedded here and there.
>
>And if you actually were concerned about your fellow ham anyway, you'd

>understand not all of them like playing with your little BBSs, they like
REAL
>networks.

I'm quite happy to see the tiny minority who prefer amateur TCPIP play with it all they wish. -- As long as they "Play well with others"... That means no "Amateur Telephone", no "Internet Forwarding", and none of the other non-ham garbage which appears to be firmly embedded into amateur TCPIP.

>Don't confuse REAL network with a installed infrastructure. I realize
>that there is not a huge TCPIP infrastructure, but that doesn't restrict it
from
>being a true network.

Who cares? It has so little functionality (as an amateur radio net) that effectively it does not exist.

Hams tend to prefer things that work. Today.

> BBSs have a huge infrastructure, but they are not true
>networks. The only shared resource that is worth using over long distance
>through a BBS "network" (joke, HAR!) is slow, unreliable email.

When amateur TCPIP can move ANYTHING at ANY SPEED across the globe using radio, you will then be in a position to criticize the BBS net. So far the score for global RF messaging is :

BBS net: Slow but improving
TCPIP: Nothing

>So when it comes
>down to community service, its really not even reliable enough for that
sort of
>use.

Yeah, right, BOZO. Tell that to the folks who had their lives saved last week in Waco.

Of course, to be fair another score-card should be looked at, concerning community service.

BBS net: Slow but improving
TCPIP Nothing

>

Not on the GSM setwork. In the nordic countries we also use NMT,
which can easilly be tapped.

>now possible even when people are far away from each other.

This is not the "most people" list. Remember that Digital Amateur Radio is
the subject matter here, and you will find it much easier to make comments
which are relevant to the discussion.

>Look at
>the popularity of telephone chat lines, cellular phones, the internet,
>CB and amateur radio (e.g. the all day long nets on 80 m). For these
>people, they just pick case by case the most suitable medium.

That's exactly right.

When you want to do "amateur radio", you get a ham ticket, and then use
radio on the ham bands.

You don't do "amateur radio" with the telephone, CB, the Internet, or signal
flags, because (just in case it slipped by you somehow) none of those ARE
amateur radio.

>For
>licensed radio amateurs to communicate with other licensed radio
>amateurs, amateur radio is often the most suitable means of
>communication.

How clever! Did you stay up real late last night, thinking that one up?

>However, the same persons may still communicate with
>each other with different means of communication (such as phone, fax
>or internet) in different situations without feeling guilty.

Sure. Why not?

Most of us, however, are intelligent enough to differentiate between the
different systems, and do not confuse one with another. For example, only a
certified moron would utilize a CB or Internet connection and then go on to
call what he just did "Amateur Radio".

Get it?

>For them,
>the communication is more important than the medium.

Yes, such people have made it plain, over and over again, that they could care less what damage they might be doing to any particular network with their moronic activities.
(Such as the obsession with moving data intended over one network over another one instead, irregardless of the many problems this inevitably brings on, the damage that follows, and the many people who ended up being inconvenienced.)

>In amateur radio it is also possible to do a lot of experimentation,
>such as experimenting with circuits, antennas, protocols (in the broad
>sense) etc., but unfortunately only a small minority of licensed
>amateurs are interested in these kind of activities.

Since when? You must hang out with a particularly inept and ignorant bunch of amateurs. Birds of a feather, I would suppose.

Let me guess -- You are involved in one of those isolated, insulated TCPIP LANS, aren't you? That would explain your mistaken perception of widespread ignorance and lack of "snap" within the amateur community.

To get a better idea what's really going on, try socializing with the "mainstream" hams a little more. - You will find that your little TCPIP LAN is really a drop in the bucket, and hardly something to judge all amateurs by. You are really being unfair, OM.

>If we are going to define amateur radio with a narrow, purist
>attitude, there is not going to be much people left to maintain a
>vivid community.

If we were all stupid enough to forget that it's called Amater Radio, and not "Amateur Telephone" or "Amateur Signal Flags" for a good reason, it may be possible for Ham Radio to die...
Fortunately, the great majority of amateur are intelligent, thoughtful individuals who are hip to the hacker mentality and the kind of destructive, thoughtless jerks who go with it. -- So the ACTUAL chances of amateur radio dying are really pretty remote.

Don't worry, Paul. Hams will do just fine.

Many radios can do this.
Easily.
I cut a green wire on my Yaesu FT-530, and it receives cellphones. I did it mainly for the out-of-band transmit on UHF, because the radio, when at lowest power, puts out legal power in the FRS frequencies, so i can talk to my friends who have FRS radios. That turned out to be kind of a waste though, so i just left it modified for the sake of not opening it back up and fumbling with rediculously small wires.
So yes, for a FACT some FT-530s (later models had some components changed and may not be able to get cellphones though...) do this, and many scanners do, and i've seen an alinco, and an icom do the same. I'm sure that there are many others.

Even though the US is the only country I know of to fight for the right of other countries to be able to listen to any radio they wish and then a few years down the road, turn around and make it illegal in our own country, I think many people can and do listen to cellphones... I tried to see if the mod sheet i followed was correct. But seriously, who would care to listen to a bunch of "hi hon, i'm on my way home, do we need milk?" conversations? Sorry, but even though my rig does it, i'll stick to scanning the police freqs, weather freqs, FRS freqs, and of course, the Ham freqs..

Eavesdropping just doesn't seem "right..."

;)

>For most people the hobby is communicating with other people.

No, the hobby of amateur radio is communicating with other people *using
radio*.

>If we are going to define amateur radio with a narrow, purist
>attitude, there is not going to be much people left to maintain a
>vivid community.

I don't think my definition is narrow. If you remove the use of radio
from amateur radio, then you have a different hobby!

To return to the comment to which I was replying - "Packet WILL die
unless we keep up with technology. Who, after experiencing 56k6 internet
access can cope with 1200baud access to a BBS?". Now lets try a few
variations on that. The same person could say:-

"Who, after experiencing the reliable, high quality phone service
offered by British Telecom can cope with SSB on HF amateur radio?"

Or how about -

"Who, after experiencing the high quality television service offered by the BBC can cope with amateur TV?"

Etc...

There are few aspects of amateur radio which provide a quality of service that can compare with commercial services. However, radio amateurs continue to use SSB on HF and they continue to use ATV, because it is amateur radio and because it offers an interest, a field for experimentation, and a challenge. All I am saying is that packet must be looked at in the same way - as *part of amateur radio*, not as some sort of would-be commercial service that is supposed to be able to compete with the internet.

I'm not saying don't develop the packet network, but what I am saying is that in developing the network, we must not lose sight of the fact that packet is *part of amateur radio*.

> with them doing so.
>
> This does not mean that it is acceptable for them to engage in activities
> designed to damage or destroy the packet radio network. One central tenet of
> amateur radio is that hams should avoid activities which will tend to lessen
> the enjoyment of other hams. Phil Karn's followers violate this rule of
> behaviour every day, as they attempt to dismantle and destroy the amateur
> packet radio network which was built through the cooperative efforts of
> countless hams around the world. This behaviour is simply not acceptable -
> Among hams.
>

Perhaps they feel YOU are the one damaging HAM radio by confining it to power hungry sysops, and their antiquated information distributions systems (note network was not a chosen word). Perceptions easily disguise themselves as truths.

I know what I perceive and what I think is truth. I perceive TCPIP and later variations to be the end all for networking for the general masses, a mass which I throw HAM radio operators into. If need be, based on facts, I am able to shift my perception, its just that I am currently using the internet to make this post, and cannot currently justify a shift to AX25 and BBS mail transfer systems as being the optimum global coverage that HAM radio needs, since it's failing and the internet is thriving, based almost solely on its protocol which allows diverse systems to be connected into one network.

> If Amateur TCP/IP (NOS) can only work if the radio network is destroyed and
> replaced by telephone links, then as hams we can do just fine without
> TCP/IP.
>
> Ok, where's your global RF net? You've had the same amount of time the real
> hams had. Where is it?
>

There you go with that old cliche, REAL HAMS. I charge you to reread the ending of my previous post about that.

Pertaining to your statement that I have had as much time as the "real hams", whatever that means to you, I will not be held accountable under your law, and if I were, you wouldn't be able to prove such accountability for the failures of others anyway. Check my liscensing date on the callsign database. The logic speaks for itself.

> >Where is your basis?
>
> See the above.
>

I didn't see anything above but emotion, no logic or reasoning, and you have proved the fact that Phil Karn is a protagonist that has prodded you into action via emotional stimulation. Nothing more. The HAM network has not become a vast web of fiber, as I've seen, but the BBS network IS beginning to collapse. TCPIP had nothing to with it. BBS's just don't cut it.

> I have never suggested that TCPIP be removed from radio land, as you put it.
> I've said we could do without it on many occasions, though, and I'll
> probably mention that fact a few more times.
>

Thank goodness you can at least admit it CAN have a place in radio. Your previous arguements did not lead me to this conclusion.

> TCPIP has potential for local nets, but has proven to be really useless for
> long-haul stuff with radios. The central problem here, of course, is that
> TCPIP really SUCKS unless you have a high-speed link. AND there is currently
> no way to provide those high-speed links on a wide (national, global) scale
> via Radio.
>

Not really. The entire internet exchanged alot of its data over 1200 and 2400 baud links in the early eighties. Its the beauty of packet switching that it is based on. Telephone companies haven't invested in band width as much as they have research into switching and data compression. There is alot to be squeezed from the long range links we have now.

> So we use what works instead. Sorry, but that's how it is OM.
>

What does OM mean? Is this a continuance of your derogatory name-calling of anyone who opposes your viewpoint, or is this simply a term for other HAMs?

> "Reasons"? You tell me I've been given "chance after chance", and again
> your poor grammar makes it hard to follow your alleged train of thought. A
> good idea, right before that sentence, would have been to give a clue about
> what "reasons" you are blathering about.
>

My grammar is not poor, I just choose to use the largest wordings and phrases as possible, because the reader's response to it gives me a good picture of their emotional threshholds. I'd say, reread it if you do not understand it. I'd rather debate with you than grade your papers.

> Yes, I know that you hate to be reminded of the fact that you are not the
> world's only ham, and that all those other hams are just as important as you
> are. I know it bothers you be reminded that you have a responsibility to
> those other hams, and that yes, your behaviour DOES matter. When I mention
> these things, I'm sure that YOU feel quite emotional, but in my case I'm
> just pointing out a simple fact.
>

I feel no emotion over the matter, except comfort, perhaps. I know I am not HAM #1 or HAM #80980980808098098 for that matter. I'm JUST A HAM. But a HAM I am, and as so, entitled to my own perceptions, opinions, and methodologies, as long as they are founded within the realm of FCC rules.

> In the TCPIP community, perhaps. The amateur radio community has a
> long-standing tradition of fellowship, decency and courtesy which appears to
> have been too socially advanced for you and many of your TCPIP peers to
> comprehend. In the past, most hams were generally civilized and had no
> trouble understanding and living with these concepts. - That was before the
> bitter negativity and moronic insistence upon non-cooperation we as hams
> have had to endure from the isolated, insulated amateur TCPIP community.
>

If anything its the BBS sysops (if anyone from my area is reading, I will admit its not in your personalities for that sort of behaviour) that exhibit that sort of behavior. "My BBS or the road. Heck, don't even consider putting your own up! It would take away from MY bandwidth" attitudes have boiled from the BBS sysop's mouth for years.

> That's a rather poor, obvious lie. You're starting to look almost as
> incoherent as Steve Sampson.

If you can't even shove your way into the current system, then you are forced to establish and provide your own. Not a lie but sad fact that TCPIP'ers have had to live with.

The whole roadblock for TCPIP is summed up in the statement, "God may have created the world in 7 days, but He didn't have to deal with an installed user base." - PCM. The BBS ops have seized on the installed base as their ticket to maintaining their towers of control.

> >We are forced into a system that where might makes right
> >or in this case the standard.
>
> No, actually right makes right. --- Except to amateur TCPIP goons.
>

I stand by my comment. Prove your counter comment. Need proof for my arguement? The BBS system, need I say more? Now that the people who are actually spending money have to contend with that installed user base, even though the user base isn't the one investing any longer, they are fighting a uphill battle. They start resorting to desperate means.

> >After enough might is exerted, the old systems
> >pass away, and everyone is forced to try new stuff, our stuff.

>
> Oh, I'm scared!
>

You should be. BBS will die, regardless of the fact whether or not TCPIP does or does not. And you base your whole HAM world on it, so yes, fear should be an emotion that you give rise to when considering the possibilities.

> Poor sod. I wouldn't admit it if I were that stupid. Well, if I were really
> that stupid, maybe I would.
>

Is it that stupid? It has prodded you into reinvigorating amatuer packet, if in the totally wrong direction.

> Do you know what a Packet/Internet gateway is? Do you know what they do?
> Hmmm?
>

Actually, I bet you don't! You consider it a amprnet patch, plain and simple, but a gateway is a router, plain and simple, first of all, then a patch for packet forwarding. That is they route packets that pertain to addresses on the internet to the internet, and contain packets destined for machines in the radio intranet to the radio intranet. Tunneling is what you speak of. That is, using the internet to move packets from one intranet to another instead of radio links. I really hope my explanation didn't teach you anything new, or I would suggest that you go read a networking manual. Check out Grapes. I can only assume that you feel that using a gateway simply implies using the internet to patch into amprnet. Thats plain goofy. Its biggest value, is that it opens up the data of the internet freely to those HAMS who want to use it.

> Quit pretending to be even more ignorant than you really are. Everybody sees
> what you're doing. Folks who are desperate because they are losing the
> debate often do that, and we're all familiar with it. Don't waste your (and
> our) time with any more of that stupidity, please. If you realize you have
> lost the debate, be a man about it, OK?
>

Thanks for taking an opposing viewpoint, calling my viewpoint stupid, and proclaiming yours superior. Debates are for reasoning, not declaring yourself superior. I even notice that you went even further and proclaimed your feelings as the feelings of everyone on the matter. You have won nothing, and I am not out to win, I am out to hold the ground between you and the total annihilation of modern technology and theory in a hobby that was once catered to the leading edge.

> I'm quite happy to see the tiny minority who prefer amateur TCPIP play with
> it all they wish. -- As long as they "Play well with others"... That means
> no "Amateur Telephone", no "Internet Forwarding", and none of the other
> non-ham garbage which appears to be firmly embedded into amateur TCPIP.
>

Good, but no one in my area is offended by the use of or work required for TCPIP. I have been checking into this, and I have not received any opposing arguements in my mailbox or on my 2m ragchews, yet. I guess I am just a "maverick" tcpip'er and am actually nice to my fellow hams as they are to me, because I choose to be, not because you obligate me to be. I have a very strong feeling you are speaking from your hat and not fact when you claim TCPIP'ers are just generally radio burning, fiber optic using nazi's.

Also, why should it bother you then if other hams do use internet tunneling? You don't use TCPIP so it doesn't affect your radio habits one way or the other. It is in actuality a designers implementation issue, and a matter of personal descision that is typically based on cost, not yours or any other wanna-be's authority. I think it would be more impressive to have radio links, but the installed base who contributes nothing, is happy tapping away at BBSs all day long.

> Hams tend to prefer things that work. Today.

I guess thats why the BBS system is going to pot, eh? Point gladly taken.

> When amateur TCPIP can move ANYTHING at ANY SPEED across the globe using
> radio, you will then be in a position to criticize the BBS net. So far the
> score for global RF messaging is :
>
> BBS net: Slow but improving
>

Improving? I need some facts, and just the facts . . .

> TCPIP: Nothing
>

Global RF networking is working in the commercial arena. That only proves to me that my fellow responsible HAMS like you declare yourself to be, or simply being lazy about it.

Check out those Europeans you bow to continuously, and you should bow, they are innovators. They are running TCPIP from island to island. Its us, the BBS'ers in America, that are preventing a global TCPIP network, not the difficulty of TCPIP itself.

> >So when it comes
> >down to community service, its really not even reliable enough for that
> sort of
> >use.
>
> Yeah, right, BOZO. Tell that to the folks who had their lives saved last
> week in Waco.
>

Please post some of those bulletins and crucial life saving messages that were sent across the packet BBS forwarding system. Also, please include its fartherest reaching destination and the date/time/location it was sent from and date/time/location that it arrived at. The destination does not actually have to

be one of the crucial ones in the chain, I just want the fartherest.

> Of course, to be fair another score-card should be looked at, concerning
> community service.
>
> BBS net: Slow but improving
>

The dying BBS system is improving community service? Communities rarely use HAM service for anything, now that cell companies have discovered they get alot more customers if they show up with portable cell towers and tons of free cell phones at disaster sites. The biggest use non-HAMS have gotten out of a HAM operators has been to pass voice traffic on HF voice nets. MARS basically covers this for the military, and civilians have the internet, telephones, and cellphones. The few who use the voice message passing networks, simply find it "romantic".

> Nope, but if you are too self-centered and ignorant to understand that you
> DO have a responsibility to your fellow hams, there is only one "bad name"
> for you which really fits...

I do have a responsibility to my fellow HAMs, that is to not interfere with their communications. As long as a basic CDMA access scheme is employed this will not happen. By getting my ticket, I in no way obligated myself to providing the majority with whatever services it wanted. That is my choice. Once again, I beg you to stay with facts, not emotion. Whether I currently am preparing a system or not (I am) actually has no bearing whatsoever on respect and responsibility.

> Amateur TCPIP apologist! That says it all.
>

I thought I stated before, I apologize for nothing in the amateur realm for I offend no one, because I am responsible and do not interfere with others.

However, you should act your age and attempt to apologize for the continual name calling you inflict on YOUR fellow HAMS.

> 73 DE Charles, N5PVL @ N5PVL.#NTX.TX.USA.NOAM
> http://www.texoma.net/~n5pvl

Name's Charles has called Dave in this post:

1)sod
2)TCPIP apologist
3)BOZO

Character attributes assigned by Charles to Dave during a debate between what I thought were logical people:

1) Ignorant
2) Stupid
3) Dishonest
4) Grammar impaired

You, Charles, need to learn about debate, not name calling and hasty character assessment.Pearcedlpearce@eos.ncsu.edu

In article <WLYGcSABvWs0EwKd@peaksys.demon.co.uk>, Roger
Barker <roger@peaksys.demon.co.uk> writes
>Packet is part of amateur radio, as such it doesn't have to compete with
>the internet - because the internet isn't part of amateur radio! If you
>can't see that point, then I think you need to ask yourself what your
>hobby really is.
>

Hi Roger,
I'm concerned about the future of the hobby - too many people say
the Internet is easier (no exam) and with far more to offer than
amateur radio, in terms or communication. In order to maintain
amateur radio as a technological hobby, rather than letting it
degenerate into a historical subject, we need to keep up with
technology rather step on the brake.

To Charles,
The reason we don't have a worldwide tcp/ip network yet is
because of inavailability of resources. Even ordinary AX.25 doesn't
have a worldwide network for users, only mail forwarding links.
How do you suggest we span the Atlantic using RF? Either HF (no
chance) or by satellite (who's paying?)

As a general note, I'm perfectly sure everyone would prefer it if
people didn't get personal and start name-calling - it doesn't help
and makes us look bad.
Please correct me if I'm wrong?

73! Duncan G7VQF.
TCP/IP is great, it IS true Amateur Radio, and it does work. Very well!!

>>snip<<
>
>I wouldn't say that, look at grapes. They have an intranet AND use the
internet.
>Would you deem that a failure, hmmh, I wouldn't.

Remember, I'm looking at it from the viewpoint of digital amateur radio.
They could probably lose the Internet links if they were doing so well with
radios.. Why don't they? To communicate with distant hams, huh? How about
not-so-distant hams?
I'll be impressed when I see them use radios, and PARTICIPATE in the
mainstream of amateur packet radio. As long as they run an isolated,
insulated RF net, the value of their work (as hams) will be limited to that
local scale. It's a big world out there, with lots of other hams. If I had
to use a wireline or Internet link to talk to my fellow hams, I'd be
embarassed. It's not an achievement, or a temporary political move to
destroy the eveil power-mongering BBS SYSOPS... It's just plain
incompetence. The TCPIP goons insist on those wireline and Internet links
because otherwise amateur TCPIP would flop fast, in a big way. - That's all
I have to know, when judging amateur TCPIP's utility for large-scale digital
ham radio networking.

There are most certainly plenty of technically gifted folks who are
interested in TCPIP. I was speaking in a wider, more general sense. Remember
that having a technical gift does not automatically mean that you've got any
common sense.

>> Poor David just can't see the connection between amateur TCPIP, and the

I respond to logical arguement with logical aurguement, if that's what you were trying to say there. The last person I offered to "snap and hurt" had just gotten through threatening my family. I didn't have to say anything to "snap and hurt" the guy... I just stood there and waited for him to move. He did, but the other direction and so nobody was hurt.

You insulted your own intelligence and integrity through your remarks, OM... I only held up a mirror to your own stuff, and you didn't like what you saw, did you?

>It makes you mad doesn't it?

It's enough to make any ham mad.

I've always had a problem tolerating ignorance, and popular ignorance is
particularly disgusting.

>You are a emotionally motivated individual.

So? Who isn't?

> I think
>his comments are a wisely crafted motivational comment for those have
>emotionally opposed high speed world wide links for so long.

No, it's a narrow, provincial viewpoint given much wider acceptance than it
deserves.

>It has spurned you to put a web page

Nope.. I put up a web page because I get as free one with my account, and
didn't mind learning enough about web publishing to do so.

>and exhibit ill behaviour.

And you would call indifference to your fellow hams "good behaviour", I
suppose?

How about the hostile "takeover" of packet by TCPIP goons you outlined
earlier. Is that "good behaviour"?

I pointed these things out. Nasty of me, wasn't it?

> I'd say his comments were "good".

But not "good" for amateur radio. Glad you've finally shown your colors.

>> I can see where Phil would be interested in the opinions of those who are

>> These same hams constantly disparage the packet BBS store 'n forward
>> network, but insist on being a "part" of it for the sole purpose of
>> destroying it from within.

>They are just doing things the way that is necessary to get it done.

Get what done? The destruction of the global ham digital net? That's what
they are doing.

I suppose you find a sick sense of pride in apologizing for such actions.

>As I noted
>before, it has transformed you into a web page generating (which is decent
>except for diatribes on landlines) genius

Give me a break. My web page is most common. As I mentioned before, my
decision to learn about HTML was solely motivated by the fact that I had a
free page to play with. I've seen lots of better ones, done by guys who
actually knew what they were doing.

>and net saliva source. Now we only
>need to get you to channel your anger in the direction of TCPIP.

You always think I'm angry. You just don't appreciate my humour.

>Those Slavs you
>continually comment on are using tcpip along with ax25.

I comment on their equipment. Who wouldn't? It's nice! They could have opted
for the telephone too, but had too much class and self-respect for that.

>Perhaps they feel YOU are the one damaging HAM radio by confining it to
power
>hungry sysops, and their antiquated information distributions systems (note
>network was not a chosen word). Perceptions easily disguise themselves as
>truths.

I'm sorry, but I have never seen how all those BBS SYSOPs are supposed to be
holding amateur TCPIP back, or what they could have possibly done to deserve
the vendetta you outlined. ("Might makes Right", ect.)

The high-speed links you say that amateur TCPIP folks need all require use of bands the BBS net rarely if ever use. They literally are not a factor in the expansion of those high-speed LANS, for that simple reason. You're not going to squeeze 1MBPS out of 2meters, no matter how hard you try.
In other words, your negativity and adversarial outlook concerning the BBS net is entirely without rational justification.

There IS NO "competition" except the one manufactured by the stubborn refusal of amprnet to "play well with others". You manufactured an excuse for youselves, and a very poor one at that.

>I know what I perceive and what I think is truth. I perceive TCPIP and later
>variations to be the end all for networking for the general masses, a mass which
>I throw HAM radio operators into.

I'm embarassed for you. You have defined provincialism perfectly for us all.

> If need be, based on facts, I am able to shift
>my perception, its just that I am currently using the internet to make this
>post, and cannot currently justify a shift to AX25 and BBS mail transfer systems
>as being the optimum global coverage that HAM radio needs, since it's failing
>and the internet is thriving, based almost solely on its protocol which allows
>diverse systems to be connected into one network.

The telephone modem is that box which hooks up to your phone line. The TNC, on the other hand, hooks up to your radio. Once you have mastered the ability to differentiate between these two, you will be well on your way to understanding why the Internet is faster than the amateur radio digital network.
At this pinnacle of knowlege, you can then go on to an understanding of amateur radio, and why anyone in their right mind would use a slow RF link when the telephone was nearby. - Or you might discover that you are really not suited to be a ham, and should concentrate your efforts elsewhere.

>> Ok, where's your global RF net? You've had the same amount of time the real
>> hams had. Where is it?
>>
>> >Where is your basis?
>>
>> See the above.
>>
>
>I didn't see anything above but emotion, no logic or reasoning,

I thought it was reasonable to ask you where your global RF net was. You propose that amprnet can handle the needs of all of those hams who are currently utilizing the global ham digital network... OK, where's your

global RF net?

There isn't one, is there? Now, don't you feel ashamed for claiming to be able to do things that amprnet simply cannot do? Admit it... Amprnet has only succeded in making an annoying parasite of itself, not a proud, independent amateur radio network like the global ham digital net.

If the ham digital net shut down tomorrow and left it to amprnet to allow hams to communicate via digital RF, you would be afraid to leave your house on account of all the angry hams.

Build yourself an RF network.. Then you can play with the big boys.

>and you have
>proved the fact that Phil Karn is a protagonist that has prodded you into action
>via emotional stimulation.

What's that supposed to mean? Do you know what the word "protagonist" means, and it's common useage?
By the way, just because I mention Phil doesn't mean he has "prodded" me into anything, any more than the smell of a dead rat "prods" me into looking for it and taking steps to eliminate the problem. It's not an emotional thing... I just don't like the smell.

>Nothing more. The HAM network has not become a vast
>web of fiber, as I've seen, but the BBS network IS beginning to collapse. TCPIP
>had nothing to with it. BBS's just don't cut it.

I won't mention your grammer again. It's unfair.

All of ham radio is sufferring from the constant attacks of negativity-peddlers such as yourself. As such, you are an embarassment to the hobby, as well as being a minor itrritation.

The packet net, like many other aspects of amateur radio, is set back, not dead. Don't hold your breath until it dies, pardner.

>> I have never suggested that TCPIP be removed from radio land, as you put it.
>> I've said we could do without it on many occasions, though, and I'll
>> probably mention that fact a few more times.
>
>Thank goodness you can at least admit it CAN have a place in radio. Your
>previous arguements did not lead me to this conclusion.

You seem to have trouble following at times. I'm disgusted at how amprnet has been abused and stifled by a bunch of clueless jerks, and how it has been perverted into a political tool, an instrument for disrupting the work of other hams instead of attempting to cooperate and co-exist so that it can achieve relevance within the amateur radio community.

In a rational, cooperative environment (the ham world beyond amprnet) the TCPIP protocol has great potential. Under the present management it's not likely to go much further than it has in the previous decade. The Internet is quickly losing it's "magic", and is far along the way to being simply taken for granted like TV. Amprnet rode that wave, but it's crested now. Good try, but no bananna. You didn't make it during the Internet craze, you ain't gonna make it at all. (The so-called Might-Right Takover of the packet net's user base by amprnet.)

>> TCPIP has potential for local nets, but has proven to be really useless for

sort
>of behavior. "My BBS or the road. Heck, don't even consider putting your
own up!
>It would take away from MY bandwidth" attitudes have boiled from the BBS
sysop's
>mouth for years.

Not really. There are good reasons for not crowding several BBS's closely together. Since you do not see the need to cooperate with others, I would be willing to bet that you never bothered to ask for help or advice from any of those SYSOPS, and affected the snotty attitude you have displayed here.

I would tell you to buzz off, too. They did the right thing in keeping troublemakers off the net, if indeed their activities prevented you from using any of the available ham spectrum. (Which is what it would take to keep you off the air if you wanted to be there.)
I suspect that you discovered that your LandLine Lid stuff, and inability to see the need for cooperation wouldn't go over, and you then cried "sour grapes!". ;-)

>If you can't even shove your way into the current system, then you are forced to
>establish and provide your own. Not a lie but sad fact that TCPIP'ers have had
>to live with.

Well, there IS another alternative.. It's called cooperation and participation. Look them up!

We are all eagerly awiting the completion of your global RF network. Good luck! (no kidding)

>The whole roadblock for TCPIP is summed up in the statement, "God may have
>created the world in 7 days, but He didn't have to deal with an installed user
>base." - PCM. The BBS ops have seized on the installed base as their ticket to
>maintaining their towers of control.

No, no... The BBS net created the existing user base. Nothing was "seized" back then, and nothing is going to be "seized" in the future. Hams are not faceless mannikins for amprnet to manipulate, OM. They do what they do because that's by gum what they WANT to do. Wise up. You're not going to force anything upon anybody.

You are welcome, of course, to try. Everybody plays the clown from time to time, and laughter is a good thing.

>> >We are forced into a system that where might makes right
>> >or in this case the standard.
>>
>> No, actually right makes right. --- Except to amateur TCPIP goons.
>>
>
>I stand by my comment.

Hey, look out! You're standing in dog-poop!

Seriously though, your attitude is really ignorant and short-sighted. Go ahead and unsult the intelligence of hams some more.. Tell them about how you will force TCPIP upon them, like it or not.

You're almost as good a source of material on what's wrong with amprnet as good old Steve, and have probably alienated just as many hams from ever considering TCPIP as he has. You accuse me of doing these things, but I could never compete with you two. A "good" adversary is much more useful

than a confederate. Dave, it comes straight from my heart when I say that you are really great.

>> >After enough might is exerted, the old systems
>> >pass away, and everyone is forced to try new stuff, our stuff.

That's the way, Dave! I can just hear those little pocket-nazi goose-steps now, as amateur packet radio is taken over by amprnet! Haw Hawr!

You guys are a million laughs.

>Thanks for taking an opposing viewpoint, calling my viewpoint stupid, and >proclaiming yours superior.

Well (blush) I do what I can...

>Debates are for reasoning, not declaring yourself superior.

Well, cut it out then!

>I even notice that you went even further and proclaimed your feelings >as the feelings of everyone on the matter.

Nope, I said,

Quit pretending to be even more ignorant than you really are. Everybody sees what you're doing. Folks who are desperate because they are losing the debate often do that, and we're all familiar with it. Don't waste your (and our) time with any more of that stupidity, please. If you realize you have lost the debate, be a man about it, OK?

You're real big on that "I'm too stupid to know what you're talking about" stuff. I know it bores me to tears... I was just thinking of everyone's welfare, and hoping that you would stop denigrating yourself that way.

>You have won nothing, and I am not
>out to win, I am out to hold the ground between you and the total annihilation
>of modern technology and theory in a hobby that was once catered to the leading
>edge.

You should share these goals with a good therapist.

This is planet Earth, Dave. I'm a SYSOP from Texas, not some sort of paranoid fantasy. You know, a regular guy who picks his nose when he thinks nobody is looking. Wise up, OM. Go to Chill-Down city for a little while.

>> I'm quite happy to see the tiny minority who prefer amateur TCPIP play with

It affects the entire amateur community.

>It is in actuality a designers implementation issue, and a matter of
personal
>descision that is typically based on cost, not yours or any other
wanna-be's
>authority. I think it would be more impressive to have radio links, but the
>installed base who contributes nothing, is happy tapping away at BBSs all
day
>long.

They use radio to access those BBS's.. Why should hams contribute to folks
who are hostile and stupid, and insist upon pretending that the telephone is
amateur radio??

The great majority of hams have too much class to be associated with such a
pocket-nazi attitude, and steer far clear when they hear radical TCPIP
apologists such as yourself.

Keep up the good work!

Not with GSM (the system used in Portugal). I suppose it is possible to pick up the GSM network, but not that easily. However, he might be able to use a modified radio to pick up the actual cellular phone (and local repeaters that are not on the GSM system), but that would be very limited.

He best bet would be to look around the internet for radio modifications, modify his radio, and hope he gets lucky. Or he could try to find the guy on the television program and ask him how he did it (ask the tv station for the guy's name and address).

kingsnake (kingsnake@dm.net) wrote:
: How does a year in the slammer sound???

Like a major breach of my guaranteed first amendment rights.

Think about it, the government is trying to regulate what you should and shouldn't listen to. Granted, its not a new thing, but laws about it seem almost as rediculous as prohibition...

The same freedom the US fought for for other countries is now in jeopardy IN THE US ITSELF!

and why? cuz some senator got snitched on when someone heard him talking about his scandalous affairs on a cellphone....

When (maybe if?) people realize almost anything that is wireless (note that i am not DISCOUNTING things WITH wires here... :) can be received by other than the party intended as the recipient.

If you think about it, weigh all the angles, and dont just spout off for some reason (like if you have a cell phone or something), you can see that making such a law as the one that exists is a waste of paper.

Now, i don't listen to cellphones, frankly, i'm not interested.
Nor do i plan to be. In fact, I also find it sad that it is almost impossible to find a way to communicate using wireless methods without the risk of a third party interception. Hey, i'm just like everyone else and sometimes want my privacy. But there comes a point when you have to be aware of what is out there and how to protect yourself. Ever see pulp fiction? When he is bringing the Overdosing girl to the seller's house, he realizes that the guy is on a cellphone, and immediately hangs up after claiming audibly "prank caller prank caller, who is this? i dont know you!" Now, beit a somewhat semi-believable and far-fetched example, i think we should all think about what means we communicate through, because you never know who is listening...

I can't wait until the day they make it illegal to hear someone who is talking above average volume to another person at another table in a restaurant.

Charles Brabham spoke the following in anger:

<much deleted. Simple morsels to crank up a tit for tat "I'm better than you" arguement>

> >Also, why should it bother you then if other hams do use internet
> tunneling? You
> >don't use TCPIP so it doesn't affect your radio habits one way or the
> other.
>
> It affects the entire amateur community.
>

The only ones you should police are those that forward AX25 and BBS messages, as if you could actually do anything about it. I wouldn't be caught dead doing it, as its a waste of my resources to deal with BBS messages, as you have time and time again pointed out, there is already a system for that. TCPIP'ers only fund high speed links and internet routers and software developement for TCPIP, not BBSs. I can only see one positive affect, if any affects for BBS systems, that you get the high speed radio research for free if you were to ever decide to kludge it into a BBS system, and I just can't see the negative impacts it could possibly have on your BBS forwarding systems. Perhaps that is what you should elaborate on next.

Its illogical that for someone who doesn't care about TCPIP and what it can offer worries so much about what we do. If its so terrible and is going to fail, you shouldn't worry about it. I'd say, buzz off if I were to act as you normally do, but I'd rather you participate in a bright new future for packet, under the rule of the TCPIP protocol. Tinker with your 15 year old BBS system if you want to contribute to a dying breed... we've got work to do, as you so happily point out and that I am more than happy to agree with.

Charles Brabham wrote

>The telephone modem is that box which hooks up to your phone line. The TNC,
>on the other hand, hooks up to your radio.

Who gives a shit. You are talking about level 1. When are you going to graduate
to level 2 of the ISO chart?

I don't really give a shit what you do with your wires, what are you doing as a Ham
to make packet radio fun? I haven't noticed your doing much of anything besides
plug and play, but you bitch about every Ham who ever got a paper published.

If you're so enspired, and all of us should follow, how come your name doesn't
show up in any published articles on technology or operations?

It's easy to sit in your armchair and bitch about technical papers that were put
together through a lot of work and time. It takes no work, it means nothing.

Instead of posting 4 page babble, why not spend the energy on a technical
paper that could really be something of value. In the years you've spent on this
newsgroup, you haven't done anything that really matters. It's like a dog
barking.

Steve

Then can they be qualified as TCPIP folks? Maybe if you poke at them a
little, they will come alive.

> That's the silliest thing I've ever heard. The advantages of the
> internet over AX-25 have little or nothing to do with the underlying
> protocols involved. Changing the radio net to pure TCP/IP will hardly
> make it faster or more efficient. Just the opposite, most likely.

I'm not sure what comment this referred too . . . but TCPIP could be
alot more effecient if methods were used to increase the effective
packet size, and get rid of the long winded AX25 header. The house is
too small for the both of them, but a properly designed lowlevel
protocol could provide both compression and forward error correction,
allow larger packet sizes, and greatly increase effeciency at 1200 baud.

> Where is the global net? That was the question. While you're at it,

> business in this discussion.

Volunteers can do it if they wanted. They set around and forward mail by hand (at least some do) don't they? What if they instead spent that time on network maintenance and upgrading? I realize it couldn't approach the level of the current internet, but I expect you just might be impressed with what could be done.

>
>
> You call yourself a ham and you don't know what "OM" means? The mind

> problems, it just gives up and goes to a non-ham alternative.

Not really (though I am not proposing internet tunneling) . . . as pertains to my solution, but none the less, a hybrid network still has radios. There is not much to be done over HF links, and the monetary investment required for multipath/multihop cross country feeds is prohibitive at high speeds. We could sap alot of bandwidth out of the system as it exists but in switched packet mode with intelligent routing and data compression. Mail and bulletins could be moved alot faster over such a system. I don't know of many that could deny that.

>
> They designed it, built it, and maintain it, usually at considerable
> financial and emotional expense. Where were the TCP folks when this
> was happening? Where is the alternative net? Where is the discussion

I have no idea, I was just getting my first computer at that time, and had never heard of amateur radio. You tell me . . .

>
> The BBS system is in place, and works, at least what there is left of
> it. Where's the "better" system that we are supposed to move to?
>

The BBS system has planted itself deeply. Eventually when its unrooted, it will be replaced. Change no matter how hard it is opposed, typically happens anyway. It will be sad to say however, instead of a smooth transition when the internet changed to TCPIP, we will have a virtual blackout that will fuel and uproar, since we fail to look forward.

>
> Pure whining rationalization. The folks who build the BBS/NetRom

Not you again, everything anyone says, except for Hank and Charles, is simply empty words and insults. Spare me ... I will however strike this from the record to finish replying to your post. I haven't insulted you or Charles, so get off that soapbox before it collapses.

>
> I have no fear. What I have is a bad case of burnout and apathy. I'm
> waiting for somebody else to do the work for a change, and offer ME a
> ready-made plug-and-play packet system that I can use with little
> personal investment of time and money.

Its coming . . . well at least the intercedent between radio and computer, specifically designed for TCPIP, only, though the software will route packets via routes found in AX25 headers. I can't explain any further at this time. It may end up a trade secret.

>
> I don't need GRAPES or ham radio to access the internet.

So, need and want are two totally different things. I got into HAM radio cause I WANTED to play. Not because I needed to. Think about it . . .

>
> Another really ignorant generalization that's contrary to the facts.
> That "installed base" did the work that made it an installed base.
> Now you want to whine when they use it as it was designed. Feh!

Now its implanted and can't be moved over for better. Thats real good, isn't it?

I'm not sure whether or not it is a good idea to continue this conversation or not with Charles, but you are, for the most part, reasonable. An admirable trait.

>critical mass in our area. You have to have that in order for this to
>succeed.

This is indeed a big problem. As I see it packet has a number of annoying
problems:

1. To make packet work requires the cooperation of a large number
of people to establish a packet network. Unfortunately, many
people seem to have a stunted sense of cooperation.
2. It's slow. Abominably slow. Unnecessarily slow.
3. The Internet is faster, cheaper, and more acccessible.
4. Experimentation in software and protocols has essentially
ceased.
5. Hardware is still expensive (why does my 56k baud modem
cost less than my 1200 baud tnc?)

What can cure these ills?

1. I dunno how to increase cooperation among hams. Perhaps
we just need to admit that building and administering large
networks is costly and difficult, and find a different goal
for packet radio.
2. We need a high speed reproducible design to bootstrap a
new level of throughput for packet. This will likely also
include a move to higher frequencies, such as 900mghz, or
10 ghz.
3. We can't compete with the Internet. Don't try. Figure out
other cool things to do, such as APRS.
4. Encourage new software development and protocol development.
5. Try to leverage available hardware (such as the available
Linux soundcard drivers) or make better use of new technologies
to bring costs down.

>Also, there was extreme fanaticism on the part of only a few key people who

>destinating a message. Now we get upset if it takes more than 5 mins to

>anywhere in the world. The BBS ops seemed to me to be the most opposed to
>this since they somehow thought they would loose power.

It is a vicious cycle. The more often messages are dropped or lost, the more futile it seems, and the more people drop out of packet. This creates even more outtages, and so on and so on until nothing gets through.

This whole "power" thing that BBS owners seem to go through is really detrimental. Face it: you run a switch. It's no big deal.

>I think I am being honest when I state that as a group the BBS ops often

Your right. Try APRS. It's growing VERY rapidly. Plus it's fun as well. Also try talking up packet. I do as much as possible. One draw (out of many) of APRS is that it's graphical. Tracking mobile stations, balloons (like the around the world balloon), NTS, weather, special events, etc. Lots of uses.

> 2. Why is there "not much to be done over HF links"?

I was referring to the digital speed limit on HF that currently stands by reason of the FCC. Of course you can gang lots of links, but at the expense of lots of radio vs. if the law was not so, and we could "burn down" HF with just a few channels. I was not implying that HF was physically limited, but that it was legally limited.

Hank Oredson wrote:

> 1. A "hybrid network" still has telephones ... and that is it's problem.

I understand your point, no telephones, no tunneling, no incidental routing through the internet, and I have no problem with this and through software, an easy solution exists to prevent it (subnets), but ...

Do you also preclude ever interfacing to the internet for its informational value to the HAM community? That is the proposal that I have attempted to convey, but I seem to get attacked for LLing before anyone even reads further enough for understanding.

Like this model:

Suppose Joe Ham wants to get Bob Hams web page?

So the DNS located on the radio network looks up Bob Ham's IP address and the packet is fired out over the radio, through ever how many nodes needed to gets its destination.

But then suppose Bob Ham wants to get onto the FCC callsign database later on to look up Joe Ham's callsign? Packets must then flow from the Radio Network to the Internet and vice-versa. Or even if QRZ database exists on this TCPIP network, it must get updated, so it also must query the servers located on the Internet at FCC headquarters. Is this considered Amateur Telephone by your definition?

Thanks,

David

Thank you, Gary. I have seen old landline keys with two sets of contacts, for MAKE and BREAK, I was told, and had tentatively assumed that the BREAK signal actuated a damper to stop the sounding plate from vibrating or something, but also had considered the possibility that there were two sound plates. Things are getting clear now.
Does anybody following this thread have an antique sounder? A diagram or detailed description would be both educational and entertaining.

>>
>
>Hi Roger,
>I'm concerned about the future of the hobby - too many people say
>the Internet is easier (no exam) and with far more to offer than
>amateur radio, in terms or communication.

To reiterate the point I made in my previous posting, which you
presumably don't understand - The public telephone service has far more
to offer in terms of communication than HF SSB and has done for many
years, but that has never stopped amateurs using HF. The BBC has far
more to offer in terms of television pictures than amateur television
and has done so for many years, but that hasn't stopped amateurs using
ATV. The local supermarket has a far larger variety of fish to offer
than the local river, but that doesn't stop anglers lining the river
banks every weekend. Etc...

In comparing the amateur *radio* packet network with the internet, you
aren't comparing like with like - one is part of your hobby of amateur
radio and the other isn't. If you insist on basing your approach to
packet on that comparison, then you only have one option - give it up!

> In order to maintain
>amateur radio as a technological hobby, rather than letting it
>degenerate into a historical subject, we need to keep up with
>technology rather step on the brake.

I'm not saying step on the brake - just the opposite, I'd love to see
people step on the accelerator! There is a huge technological challenge
available to anyone who wants to take up amateur *radio* in this country
in building a better amateur *radio* packet network. Where's the
technological challenge in the internet? Making sure you plug your modem
into the correct COM port on your PC??

>73! Duncan G7VQF.
>TCP/IP is great, it IS true Amateur Radio, and it does work. Very well!!

You mentioned in a previous posting that you -

>run exclusively TCP/IP in a regional network with likeminded friends
>here in SW England. We want to keep up with technology as much as
>possible - the only things stopping us are the 'not-true-amateur-radio'
>brigade, and those who think that 9600baud+ is still experimental!!!

Why is that stopping you? If you want high speed facilities, and the attitude of some local sysops is "if god had intended us to use 9600 baud then Tiny-2s would have been born with RUH modems" then get out there and do something about it - that's what amateur *radio* is all about. Build your local high speed *radio* network, then build some *radio* links to the next area where there is tcp/ip activity, etc. There should be enough technological challenge there to keep you or anyone else going for several lifetimes!

Thanks Al,
Yeah I figured that would be the case, I'll have a scout around for a simple
audio type filter, hopefully that will make the difference.
I often hear signals that are down in the noise and can't decode anything,
and even when I can copy , I'm nervous about embarking on a QSO in case the
band drops and the screen turns unusable.

But have to say "when it works it works!", so I've always remained
optimistic I could get it firing.

Charles,

I 'm sorry you're in no position to comment on a network you know nothing
about. I live here and see it, much to my disappointment.(sale/want
bulletins don't exist in VK).

> Only the socially retarded would suggest that discussion of issues be halted
> or limited because the participants disagree with each other and differing
> opinions freely circulate.

Charles ,

I wasn't suggesting anything of the sort, freedom of speech must prevail.
However people tire of paying so others can stroke their ego's in a public
forum. They switch off, and find something more constructive and enjoyable
to do.

> Usually it's a LandLine Lid who you will find trying to limit other ham's

> >"trash". Packet *MUST* serve a *purpose* for it to survive, how fast it is
> >of secondary importance.

> And there is the negativity you were so dishonestly leading up to.

Charles,

People have only so much time and money to devote to the hobby, unless
packet is perceived as being of relevance and of use to them they will take
their hobby dollar and hobby time elsewhere.

> >
> >Being able to forward "mega-bytes" of mail via packet (or amprnet) is
> only
> >worthwhile if it's of value to somebody, and I hate to say it... but it's
> >mostly rubbish.

Charles ,

I am constantly being told by local hams that they aren't "into" packet
anymore . Several reason are usually sited - lack of technical discussion,
the outdated nature of dx bulletins, lack of technical bulletins ,all
the politics (read shit fights).[Speed of network seldom a factor]
I'm being told that they can get all the above cheaply and dependably on the
"internet" courtesy of "usenet" and the plethora of mailing lists available.
Packet *is* competing for a slice of the 'market' , so these problems have
to be addressed, as without users there is no packet network.
Charles I wasn't supporting any point, just "telling it as it is down here",
unfortunately. Now users just don't care about this petty war being promoted
by some people (name calling-spitting -insulting), they want to enjoy the
mode, and just won't hang around if they don't. That's not negativity it's
fact.

Many thanks for your very thoughtful comments Charles , I'm hoping for a
brighter future for packet radio in 1998 as I still enjoy the mode.
I'd like to wish you all the best for the New Year and Happy Packeteering.

>Masa would still be the town clown if he could copy Morse code at 50 wpm.

Are you kidding? He'd be embraced by the pro-code zealots as a god!

>He enjoys playing the fool ...

How do you know? Have you asked him lately?

> ... - the difference between you and Masa is he
>realizes he's a fool. ...

You claim Mr. Masa is a fool, and you claim Mr. Masa knows this:
1.) You seem to make the claim simply on the basis of Mr. Masa's
(in your view) clumsiness with language, and apparently for no other
reason.
2.) Again, has Mr. Masa communicated to you this supposed "realization"?
3.) IMO, the one who appears to be the "fool," the "jerk," and the "town
clown" is the brash, snootishly arrogant one who makes those claims
for others not like, or perhaps "as good" as himself. ;0)

> ... You could turn a church sermon into a no code debate,
>Squiggy.

If the sermon were on equality, fairness, and level playing fields, I'd say
Carl would be close in using this debate as an analogy. Of course, let's not
forget the main reason for the "church sermon," assuming the "church" you refer
to is non-Morseodist.
Now if the "church" is Morseodist, I'd say Carl would definitely turn the
sermon into a debate ... and probably get bodily thrown out the front door as
well! ;0)

>
>You aren't interested in ham radio - you are only interested in making noise.

IMO, there are many aspects to ham radio, even yours -- Belittling the
efforts of those who attempt to make Amateur Radio better, even if only in a
small way.

>
>You are bitter because you haven't gotten anything out of ham radio because
>you haven't put anything in to it. You are very confused.

It seems apparent that you don't read much, or at a minimum, do not
comprehend at all well what you read : Carl has many times referred to and
narrated his experiences in Amateur Radio, which, as I (and most people)
intrepret them, have brought and continue to bring much satisfaction his way.
IMO, it is someone else who is confused -- not to mention brash, arrogant,
holier/better-than-thou, and (not in the least) more perfect.

>think people like YOU are ham radios worst enemy. You're like the 4 year old
>kid whose ice cream fell on the floor - first thing you want to do is grab the
>other kids ice cream and throw it on the floor - if you can't have any, then you
>don't want anybody else to have any either.

Wow: THAT sounds exactly like the pro-coder attitude to me! =0)

>
>You have been a technician class ham radio operator for 25+ years. Nothing
>about ham radio ever excited you, intrigued you, got you interested. ...

Your assumption/assertion: Perusal of past WA6VSE posts/follow-ups indicates
otherwise.

> ... But you
>did notice along the way that other people in ham radio were having a lot more
>'fun' than you were, and that pissed you off.

Your words: Can they be substantiated? Or are you simply attempting to
start the new year off with a bang by laying a massive troll in front of Carl?

>
>So then along came the no code tech license, no code international, usenet, and
>there you were, pissed off, just waiting to jump on the band wagon and see if
>you could help flush the toilet. ...

Well, ya gotta admit, flushing the mandatory Morse code test down the toilet
ain't such a bad idea -- at least not in my book! =0)

> ... You always wanted to be a HERO instead of a
>ZERO, so here you are typing, in hopes of confusing the sheep.

Excuse me? Who's confusing? It seems to me one of the master obfuscators is
at work here -- and I don't mean Carl or myself. ;0)

>
>You have ZERO excuse for being a tech, Squiggy. ...

Slamming the techs again: Tsk, tsk. I'm a Tech+ and I feel fine .... =0)
What is so satisfactory, important or meaningful about being able to beep
fast -- simply from the regulatory point of view? Beeping fast, IMNSHO, falls
into the same category as contesting, DXing, ATVing, QRPing, DIGITALing, et al,
i.e. from the regulatory standpoint, there is NO justification for testing --
other than for knowledge of technical aspects, what other mode/coding/decoding
scheme is tested for? From the personal and operational standpoint, there is
EVERY justification for usage, development and implementation.
And, where in Part 97 is it written that one must upgrade? I believe that
requirement was dropped some time ago -- though IMO there are still those who
think that's the way things STILL work (or at least wish they did) -- they
cannot -- nay, WILL NOT -- get out of the stagnating swamp of status quo!

> ... You have expounded many times
>in the last two years how much you know about electronics. And a few times you

>keeping me off HF' baloney. If you can copy a CQ at 40 wpm, you can damn sure
>pass a 13 WPM code test and get on HF and do all the experimenting you want -
>but that's not the real agenda ...

The "real" agenda is getting the Morse code testing requirement removed.
It's that simple: So simple, SOME people can't seem to get it. ;0)

> ... - your real agenda is to cause as much hate and
>discontent as possible and see if you help throw the ice cream on the floor.

Talk about "hate and discontent": IMO, your vibes could collapse San
Francisco all over again ... no probl�mo, KemoSabe ... ;0)

>
>You're a fraud, Squiggy. A fake. ...

And, IMO, you're needlessly arrogant and intolerant ....

> ... Sad thing is, you have worked yourself up
>into such a rage ...

Seems to me someone else here isn't exactly calm ... =0)

> ... and you spend so much time slobbering over a keyboard, that you
>are about the only one left here that doesn't realize that. You need help.
>Professional help.

Hell, there is no such thing as "normal": We're ALL crazy -- some of us more
or less than the others. Those who think otherwise, IMNSHO, are seriously
deluding themselves .... ;0)

>
>You are not interested in ham radio - you are only interested in making noise.

Seems this post/follow-up has made quite a lot of noise all by itself ...
(ouch! My ears hurt!) ;0)

>
>But I'll tell you what I am going to do. ARRL membership now, I think is $36 a
>year. I have no idea what it was 22 years ago, so I will use todays figure.
>$36 times 22 years is about $792. We'll round if off to $800.
>
>I'm going to give you a refund, so you can have back everything you have put
>into ham radio. You throw away the usenet software and go find a good head
>doctor.

I think everyone, *especially* r.r.a.p. devotees, needs to have their head
examined periodically -- just to make sure the invective and trash don't do
permanent damage to the interface circuits of the ol' grey matter .... ;0)

>
>You explain to him that you are consumed by the fact that you hate ham radio,
>and ask him if he can give you some help. If he says yes, you tell him to send
>me the bill for the first $800 worth. I'll look at it as my investment in the
>future of ham radio......

This is beginning to look a lot like a "last grasp" control issue here ...
did Carl strike an extremely sensitive pro-coder nerve somewhere?

>
>I've noticed you seem to have a problem finding things I post in usenet lately,
>Squiggy, so I'll email you a copy of this to make sure you get it. My usenet
>feed just isn't that reliable, I guess.

Some might think it's not only the usenet feed that's not reliable ... =0)

(Gee, Maw ... did I say THAT?)

>
>73, Jim KH2D
>
>
>

Happy New Year! Try to calm down a little -- we have a lotta year left to
mangle .. er ... debate in! ;0)

BTW: Did you know that yesterday, in 1838, Mr. S.F.B. Morse first demonstrated his new code and new telegraph at Morristown, NJ? ... this is the same town where Benedict Arnold was court-martialed ... 1838 was also the year S.F.B. failed to interest Congress in constructing a telegraph line -- maybe more practical folks knew something (even then)! ;0)

I'm sorry, I don't know who you are. Are you someone important? I guess
I don't recognize, or are aware of your accomplishments.

That's not to say you might have done something important, it's just that
I'm not aware of it. Was it something to do with networking? I usually
follow that technology, both RF and non-RF.

I could make a few suggestions. My first act as the ARRL President would
be to petition and lobby the FCC and Congress, to make it illegal to
transmit within the States and territories of the United States, for more
than 100 ms, and 100 Watts. That AM and FM would be illegal within the
Ham bands. That there would be no bandwidth restrictions on HF or
higher within the Ham bands.

With that stipulation I have many suggestions for bringing the ARS into the
20th Century past the Choo-Choo modes, and then into the 21st!

As it is now, I don't see how the ARS can exist on VHF and up, with the
dwindling population. AT&T and Motorola will own most of what we call
the ARS service bands.

Steve

Not much John !

I also have a KPC-2 and I keep it for emergency backup. You can buy a brand new KPC3-Plus for around $130.00 these days. In addition, the KPC-2 is very limited in memory and capabilities. If you are lucky, you might get $25-$50. That's why I decided to keep mine. (By the way... even "slightly used", the KPC-2 is two generations back... no battery, no RTC (unless you bought the last update in firmware and installed the battery & RTC options back then), etc.)

73 from Bruno, VE2EQ/W6
San Marcos, California

I have a KPC3 always on-line and a DSP-2232 on HF/VHF.

If indeed Karns' remarks were as represented and were in context, then
I believe they show a lot of contempt for Amateur Radio, and an
attitude that's harmful to radio based digital comms.

>before, it has transformed you into a web page generating (which is decent

On RADIO, right?

>Perhaps they feel YOU are the one damaging HAM radio by confining it to power
>hungry sysops, and their antiquated information distributions systems (note
>network was not a chosen word). Perceptions easily disguise themselves as
>truths.

BBS sysops and node sysops are humans. They're no more or less
arrogant than any other class of people. Most of the node ops I've
seen have been willing to allow the small minority of TCP advocates to
use (and abuse) their facilities. What have the TCP folks done in
return? Nothing, at least in this area.

>my perception, its just that I am currently using the internet to make this
>post, and cannot currently justify a shift to AX25 and BBS mail transfer systems
>as being the optimum global coverage that HAM radio needs, since it's failing
>and the internet is thriving, based almost solely on its protocol which allows
>diverse systems to be connected into one network.

That's the silliest thing I've ever heard. The advantages of the
internet over AX-25 have little or nothing to do with the underlying
protocols involved. Changing the radio net to pure TCP/IP will hardly
make it faster or more efficient. Just the opposite, most likely.

>> Ok, where's your global RF net? You've had the same amount of time the real
>> hams had. Where is it?
>>
>
>There you go with that old cliche, REAL HAMS. I charge you to reread the ending
>of my previous post about that.

Where is the global net? That was the question. While you're at it,
where are the regional nets? Where can I connect BY RADIO to an
Amateur TCP/IP net locally?

>via emotional stimulation. Nothing more. The HAM network has not become a vast
>web of fiber, as I've seen, but the BBS network IS beginning to collapse. TCPIP
>had nothing to with it. BBS's just don't cut it.

OK, BBSs don't cut it. Where's my alternative?

>Not really. The entire internet exchanged alot of its data over 1200 and 2400
>baud links in the early eighties. Its the beauty of packet switching that it is
>based on.

Oh, crap. If you can't see the difference in a net based on a massive
telephone system build and maintained by a COMMERCIAL industry which
has been around for nearly a century, and a net built and maintained
by VOLUNTEERS over RADIO for less than 20 years, then you have no
business in this discussion.

>> So we use what works instead. Sorry, but that's how it is OM.
>>
>
>What does OM mean? Is this a continuance of your derogatory name-calling of
>anyone who opposes your viewpoint, or is this simply a term for other HAMs?

You call yourself a ham and you don't know what "OM" means? The mind
boggles.

>If anything its the BBS sysops (if anyone from my area is reading, I will admit
>its not in your personalities for that sort of behaviour) that exhibit that sort
>of behavior. "My BBS or the road. Heck, don't even consider putting your own up!
>It would take away from MY bandwidth" attitudes have boiled from the BBS sysop's
>mouth for years.

That is a huge problem, yes. That's a part of the reason why hams are
deserting to the 'net. It doesn't change the fact that using the

telephone is not ham radio. Your "solution" does not address the real problems, it just gives up and goes to a non-ham alternative.

>If you can't even shove your way into the current system, then you are forced to
>establish and provide your own. Not a lie but sad fact that TCPIP'ers have had
>to live with.

I'm not buying that excuse at all. There is not and has never been any sort of viable TCP network in this area. What there has been has been isolated and intermittent, and never lasts more than a few months at most. Not once has any TCP advocate talked to the owners of the existing system about using, changing, expanding, or improving it. Even the DX cluster folks have been more cooperative than the TCP crowd.

>The whole roadblock for TCPIP is summed up in the statement, "God may have
>created the world in 7 days, but He didn't have to deal with an installed user
>base." - PCM. The BBS ops have seized on the installed base as their ticket to
>maintaining their towers of control.

They designed it, built it, and maintain it, usually at considerable financial and emotional expense. Where were the TCP folks when this was happening? Where is the alternative net? Where is the discussion meeting where we try to move to the better methods of networking?

>I stand by my comment. Prove your counter comment. Need proof for my arguement?
>The BBS system, need I say more? Now that the people who are actually spending

The BBS system is in place, and works, at least what there is left of it. Where's the "better" system that we are supposed to move to?

>money have to contend with that installed user base, even though the user base
>isn't the one investing any longer, they are fighting a uphill battle. They
>start resorting to desperate means.

Pure whining rationalization. The folks who build the BBS/NetRom network had similar obstacles to overcome, and instead of whining about them, they went out and did what had to be done. They did it on RADIO. Now you want to destroy it because it's "outmoded" but you have nothing to offer but empty words and insults.

>You should be. BBS will die, regardless of the fact whether or not TCPIP does or
>does not.

That may very well be true. Where's the alternative, based on RADIO?

>And you base your whole HAM world on it, so yes, fear should be an
>emotion that you give rise to when considering the possibilities.

I have no fear. What I have is a bad case of burnout and apathy. I'm waiting for somebody else to do the work for a change, and offer ME a ready-made plug-and-play packet system that I can use with little personal investment of time and money.

>suggest that you go read a networking manual. Check out Grapes. I can only

GRAPES is several thousand miles from me. Sorry, but they don't have
much to offer me. If I lived in their area, I'd no doubt be giving
them a try, and maybe even some support.

>assume that you feel that using a gateway simply implies using the internet to
>patch into amprnet. Thats plain goofy. Its biggest value, is that it opens up
>the data of the internet freely to those HAMS who want to use it.

I don't need GRAPES or ham radio to access the internet.

>authority. I think it would be more impressive to have radio links, but the
>installed base who contributes nothing, is happy tapping away at BBSs all day
>long.

Another really ignorant generalization that's contrary to the facts.
That "installed base" did the work that made it an installed base.
Now you want to whine when they use it as it was designed. Feh!

>> BBS net: Slow but improving
>>
>
>Improving? I need some facts, and just the facts . . .
>
>> TCPIP: Nothing
>>
>
>Global RF networking is working in the commercial arena. That only proves to me
>that my fellow responsible HAMS like you declare yourself to be, or simply being
>lazy about it.

Once again, if you cannot understand the fundamental difference
between commercial projects and amateur volunteer projects, you have
no standing to comment on this issue.

>Check out those Europeans you bow to continuously, and you should bow, they are
>innovators. They are running TCPIP from island to island. Its us, the BBS'ers in
>America, that are preventing a global TCPIP network, not the difficulty of TCPIP
>itself.

Prove that remark or withdraw it. I find it insulting, and I see NO
evidence that it has any basis in fact.

More than just a radio is needed for GSM. GSM is a digital technology
(a form of TDMA). Some sofisticated hardware is needed to decode the
bitstream into audio. In the US AMPS and NMT in northern europe are
easily intercepted. (just FM analog).

>further at this time. It may end up a trade secret.

More Pie In The Sky, and proprietary, even. That's hardly in the
spirit of ham radio, if you ask me.

>> I don't need GRAPES or ham radio to access the internet.
>
>So, need and want are two totally different things. I got into HAM radio
>cause I WANTED to play. Not because I needed to. Think about it . . .

So did I. That's a figure of speech. You know what I mean.

>> Another really ignorant generalization that's contrary to the facts.
>> That "installed base" did the work that made it an installed base.
>> Now you want to whine when they use it as it was designed. Feh!
>
>Now its implanted and can't be moved over for better. Thats real good,
>isn't it?

That's not what I said. You're the one who seems to want to destroy
the existing network before you have a working alternative in place.

>I'm not sure whether or not it is a good idea to continue this
>conversation or not with Charles, but you are, for the most part,
>reasonable. An admirable trait.

I do my best. I just cannot see, for the most part, where the TCP people have anything at all to offer me or the average ham who wants to play on packet radio. APRS is getting some play now, but there's only so much you can do with that, and it's only a niche that really doesn't need much of an infrastructure to function. For many of us, it's just a toy. It'll be useful in some public service events, but even those are limited.

The remarks were made on the now-defunct tcp-group@ucsd list, within a week or possibly two of it's shutdown.

Here's all of the origial I have, including the message title: If UCSD has the old tcp-group posting archived, you should find some interesting reading in those last few week's messages, including the exchange below.

This message fragment has been HTML-ized, then de-HTML-ized, but the text has been left intact. I've probably got the original somewhere, but rather than fool with that, I'd check for an archive.

Subject: Re: 2300 MHz band reallocated

N5PVL:
Many *NOS stations are now set up for the single purpose of misusing Internet as a cheap, dumb way to avoid the use of radios. Internet message forwarders are the best known example of this.

We can't really afford that type of stupidity any more, IMHO.

KA9Q:
Why is this stupid? Many people outside ham radio would consider it more stupid to build a radio network that uses precious spectrum instead of using existing fiber facilities with much greater capacity and lower cost.

I feel that radio spectrum is too valuable to waste on point-to-point links that are better implemented with non-radio facilities.

>Charles can be quite insulting, and I've told him so.

Charles could really care less about the "goody goody" scene when the packet net is being destroyed by barbaric techno-geeks while just about everybody else is currently sitting on their hands, afraid to hurt the feelings some thoughtless geek or another.

Go ahead and kiss up to the likes of Carl, David and Steve if that's your bag. I will continue to call 'em as I see 'em, like it or not.

My feeling is that a good old fashioned bucket full of cold, wet reality will often refresh and revitalize the discussion better than anything else.

I just describe what I see. If TCPIP goose-steppers want to avoid looking like morons and having that fact then pointed out, their best bet is to take a hike. I say this because I believe most of them are too ingorant and misanthropic to ever fit in with the other hams, and learn to play well with others. They have been given many opportunities, to no point.

If they could just figure out a way to be intelligent and cooperative without having to give up being arrogant jerks, I'm sure a lot more TCPIP devotees would find a way to make themselves more useful within the amateur radio community. But....

>technology rather step on the brake.

In the case of Radio technology, this is entirely true. Other areas of technological advance are not nearly as relevant to the hobby, and are only so to the extent that these technologies enhance the utilization of Radio.

It's easier to keep this all straight if you try to remember that you are a Ham.

>
>To Charles,
>The reason we don't have a worldwide tcp/ip network yet is
>because of inavailability of resources.

Yes, I agree. Resources such as character, snap, decency, and the ability to "play well with others" seem to be sadly lacking in the tcpip community.

No wonder they have never acheived anything except lilttle, piddly stuff. I doubt they ever will.

>Even ordinary AX.25 doesn't
>have a worldwide network for users, only mail forwarding links.

And amateur TCPIP doesn't even have that.

In fact, amateur TCPIP has NOTHING on a global scale, except a reputation for being noncooperative, destructive jerks.

>How do you suggest we span the Atlantic using RF? Either HF (no
>chance) or by satellite (who's paying?)

Yes, here we can all see the attitudes which will lead our progress into the next century...

The LandLine Lid chant " It can't be done with Radios."

No other group in amateur radio is so insistent upon their incompetency.

Well, I won't argue that.

>
>As a general note, I'm perfectly sure everyone would prefer it if
>people didn't get personal and start name-calling - it doesn't help

> developed yet?
>

Your drawing a cycle where there need not be one. When implementing anything, you first have to promote the idea, get people interested, then you can go about doing it when you achieve the backing necessary to help out when the going gets rough. There is not alot of need to build something and then promote it, as this society has shifted away from that concept. Most people feel as if they should be asked first. I don't agree with that, but in this land of the offended, its a necessary step.

> Of course, and that's one of my pet peeves. We've had PKZip for a

I differ in opinion on where this should be implemented. I feel that this should be implemented at the lowest level of a packet. If it was, you could even compress callsigns. The only thing one would need uncompressed would be a descriptor byte that would tell us what the packet is, if it is compressed, which dictionary, and the 2 byte CRC. Huffman (sp?) code the rest, with the dictionary that affords the best ratio and send it on its way.

However, this would discard the use of AX25 too quickly. An interim solution would be to implement the compression at the BBS data layer, and have it implemented as a detectable feature in a BBS node. Terminal programs and other BBSs could then probe BBSs to find out if the compression is supported or not.

> Are you not one of those defending and promoting the wonderful world
> of TCP/IP, and knocking the outmoded BBS paradigm? If you can't even
> show me where I can use it, why should I abandon the BBS concept,

As you said, you have no one in your area to do that. Once again, for me to try to hook you up, would be futile.

> If you don't know what OM stands for, you can't have done much
> hamming.
>

Actually quite a bit, but I'm mostly a electronics junkie, I prefer helping my friends get their equipment working, as I don't hear spoken speech very well at all when buried in the fuzz of a HF signal. I have been called Old Man on the radio when working at the club station here at State, as we were liscensed in 1930, but I have never been called by the abbreviations, OM, therefore you can understand my lack of knowledge as to the meaning of that abbreviation, hopefully. It just never occurred to me that anyone would abbreviate it.

> >I have no idea, I was just getting my first computer at that time, and
> >had never heard of amateur radio. You tell me . . .
>
> Then I submit that you're a poor advocate for TCP/IP, if you can't

>

You did not ask me to describe how I would implement my ideas. You asked me where was I when the BBS system was being created. I hadn't meant to offend you by not answering a question that wasn't asked . . . but since you implied you did:

1) Implement a protocol that specifies only the sender call, the receiver call, compression or not, the compression dictionary and the normal CRC. I've already got several forms of it scribbled out on paper. I am just looking for things I overlooked right now, such as hidden confirmation loops, its not as straightforward as it may seem to build one from the ground up. This protocol will be designed to carry whatever one likes, such as TCPIP or just plain old text, though a upper layer protocol would be needed to convey sequencing between first source and final destination, etc. There is no true linking layer specified, only a sequence number for packets that must be maintained, so that back to back packets can be sent and that confirmation of receiving a correct packet may be given to its sender. The sequence number only exists between to nodes in direct (not routed) contact with each other. The final addressee will also be confined to being the router or router client at the lowest level. Upper layers must provide any long distance routing, long distance being beyond direct contact, which means all machines are no longer digipeaters but are upper level protocol routers, this will of course require a increase in TNC complexity.

2) Design and build small, inexpensive routers for 1200 baud from 6809 chips or such, something very small, yet powerful enough to handle the job, and that has freely available devel tools.

3) Later on, devise powerful routers capable of handling 16 or more radios at once, so that multiple HF links can be handled, and that regional outbound traffic can be concentrated into one machine, reducing the number of sites

necessary to shoot across country, therefore lowering cost, and increasing feasibility.

4) Revise the BBS standard to take advantage of the new protocol, simplifying BBS design.

5) Have all software be capable of easy setup for upper level IP routing operation, should a user desire it, with the routing software inherently available in the software package (its will be there, so why not use it type deal), along with a upper level protocol and routing package to allow route-by-callsign to occur, because as stated in #1, the lowest level will never be routed.

6) Develop software for TNC2s that will do the same as 2

7) Increase ease of use in setting up a IP system to simple GUI point and click simplicity (thats what I will not tell you about now) and remove the hardware signal conformity requirement from a PC machine that is becoming more and more proprietary and harder to build for and write drivers, to a cheap blackbox with the minimal components required to make connecting as simple as possible.

> Probably. I'd rather have an alternative ready before I abandon it,
> however.
>

It would be nice, but packet radio has not proven to be forward looking these days, with the exception of the position reporting system, and as you note at the bottom of your reply, its not a major application, but simple and serves a purpose.

> What we'll have is hams abandoning ALL packet radio, and not coming
> back. It's already happening.
>

I wouldn't propose that dark of a future. Its amazing what the desire for keeping spectrum can do to a HAM.

> Charles can be quite insulting, and I've told him so. Your insults
> are not so personal, but you insult our intelligence by saying things
> that make no sense, and suggesting "solutions" that are unrealistic or
> that depend on non-ham solutions.
>

I have not proposed non-ham solutions. Check into my past, I have noted several times that our current long distance links, if converted to packet switching nodes, and were augmented with intelligent switching schemes, not unlike those already found on the internet, and data compression, our long distance links could handle quite a bit more data than they do now under the current BBS system.

What some consider to be a non-ham solution, is the connection of a radio intranet with the internet. I do not think that this is a "contamination" of the hobby. I want to see the long distance radio links so that HAMs have a

complete, if slow, working packet switching intranet before that happens, but at that point we have no excuse to not connect to the internet. The internet has too much data available for us to exist separate (in terms of not having a way to access sites on it from the radio network). Perhaps this is a sticking point with you also, but to accuse me of not wanting a nationwide, at minimum, radio only network, is accusing me of something that I have never stated before in any of my posts to this newsgroup, nor in emails to other net users.

> More Pie In The Sky, and proprietary, even. That's hardly in the
> spirit of ham radio, if you ask me.

I said possibly, in other words its still up in the air. Depends on how long it finally works out to take to build it and finish the software. I'm really suprised no one else has thought of it. But enough of IT for now.

> >Now its implanted and can't be moved over for better. Thats real good,
> >isn't it?
>

I do not want to destroy it, but the fact is, one must destroy to create. I'm sure a TCPIP nationwide network could exist along with what is currently available, but the hardware currently available can't handle all the code necessary to do so in an effecient manner.

>I do my best. I just cannot see, for the most part, where the TCP

But it may end up being what it takes to keep the hardware around for when the BBS system goes kuput, so that the next phase of packet radio, whichever direction it takes, can be ushered in. There is something to be said for small but useful applications.

Sincerely,

David

> thoughtless geek or another.
>

Geeks and thoughtless don't go hand in hand, however, geeks and emotionaly indifferent discussion do. I only use when I encounter someone like you, a person who doesn't seem to be able to calm down long enough to read and understand, but instead flys off onto land line lid accusation tangents without even looking at what was said.

> Go ahead and kiss up to the likes of Carl, David and Steve if that's your

>

Techno geeks, as you call them, designed your mail system as it stands if you remember. Now that you have a little taste of what can be done, however, you have chosen to turn tale and run with the old.

> My feeling is that a good old fashioned bucket full of cold, wet reality
> will often refresh and revitalize the discussion better than anything else.
>

The only reality you bring to this group is that sadly enough, you can't debate a single point without name calling or descending into landline lid analogies where they don't even have a place.

Surely you know that, in the U.S., TRANSMITTING on a radio that is not approved by the FCC for that specific radio service is illegal. Just because a radio is approved for ham use does NOT automatically make it legal for any other radio service, including FRS. You may verify this with Yeasu.

Just a hint that you may want to be more careful about including your name, etc. when you may be violating a law.

If that was what they did, then it would be hard. There would be no way
to distinguish between a dot and an intracharacter space. They'd be
equally spaced clicks. Fortunately, that isn't how wireline telegraphy
worked. The sounder makes distinctly different sounds for key down
and key up, so both the location and direction of the timing edges can
be easily recovered. Any interval that begins with a key down click must
be a voiced symbol, and any interval that begins with a key up clack must
be an unvoiced symbol. Thus all 5 symbols used by Morse can be properly
decoded via sounder.

I am looking at a KAM that is supposed to be Ver. 6

Will Ver. 6 do Pactor, or is 7 or 8 minumum for Pactor?

What do I lose with the older Ver. 6?

What is the cost to upgrade to ver. 8?

What is an older KAM (e.g. Ver. 6) worth used these days, please?

Source record: 26148

If you look in the Art of Electronics (a book everyone should have) there is a "state variable filter" that uses 4 op amps (which you can get in one package, of course). I used a similar design, but I AC coupled both input and output so I could float the ground and run the whole thing off 1 9 V battery. Without that you need +/- supply.

I'll see if I can't find my schematic and post it, although I don't know exactly where it is now.

With that filter (or my TS570's DSP I have had many enjoyable QSO).

73,

Al WD5GNR

(P.S. Have you looked at Terry's Hamcomm site? He has a version of the circuit that does passive filtering. Don't know how well it works. Don't remember the URL, but you can find a link at my site: http://www.al-williams.com/wd5gnr)

185. Where buy Baycom Chip?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-08 00:00:00 UTC
From: Paul_Wilton@roke.co.uk
Message-ID: <Paul_Wilton-0801981754200001@samac.roke.co.uk>
Source record: 26149

I am looking for a source of Texas TCM3105 modem chips as used in the Baycom modem (since I figure I can build a Baycom modem cheaper than
£50). Anyone know where I can get one in the UK? I have tried all the usual places (RS, Maplin, Farnell, Electrospeed, Electronic Services).

TIA

Paul

There are faster modems available, but no movement to ask for an STA
so that we can use them, at least not that I have heard about.

Existing modems, particularly CLOVER-2000, would allow for somewhere
in the relm of 3kbps over a voice bandwidth HF channel.

Suspect we will hear from the ip folks about how the long latency
makes them useless, but we can ignore that particular whine, since
there are many applications which function quite well with long
latencies,
and are of interest to very many hams.

A question I've asked for a long time, and never gotten a reasonable
answer: why is the ARRL not pushing these new technologies? It will take
the effort of a major organization to get the needed work (and
coordination
of effort) accomplished. Perhaps nobody has asked them?

If you want more information about what is happening with amateur
radio spread spectrum and some of the TAPR SS projects....

check http://www.tapr.org/ss/

We have several new sections and audio presentations on-line.

Latest Information available includes:

* TAPR 900MHz FHSS Radio Project (Photos and Audio)
CPU operational and RF board under testing!
See images of the VCOs image and other stuff.

* Spread Spectrum Rule Changes (RM-8737 & Doc. 97-12)

* TAPR's Spread Spectrum STA (Application On-Line)

* TAPR's Position Statement on Spread Spectrum Technology Development

* Rules and Regulations on Amateur Radio Spread Spectrum

* Information on the Buaas Special Temporary Authorization

* Biblography of Spread Spectrum Communications

* Other Web sites of interest on Related Technologies

* Collected Audio Segments on Spread Spectrum

* TAPR Spread Spectrum e-mail list

* Transmission Line Attenuation Chart

Cheers - Greg Jones, WD5IVD

TPRS Fall Digital Symposium

The Texas Packet Radio Society held its Fall Digital Symposium this past December in Austin, Texas. There was a lot of good discussion over the current and future aspects of the organization and amateur packet radio.

The following presentation were made:
Antennas, feedlines, propagation for 915 Mhz
Bob Morgan, WB5AOH

TAPR 900Mhz FHSS Radio Design
and Channel Capacity Issues in amateur digital communications
Tom McDermott, N5EG

TAPR FHSS Radio Design Status Update
Bob Stricklin, N5BRG

Update on Spread Spectrum Rulemaking and TAPR Projects
Greg Jones, WD5IVD

Texnet Update and TexNet status update
Bob Morgan, WB5AOH

TCP/IP Services on modern platforms
Greg Jones, WD5IVD and Tom McDermott, N5EG

All the audio and overheads can be found on the TAPR virtual meetings page http://www.tapr.org/tapr/html/virtual.html

190. MFJ 1278B Terminal Program with SSTV?

Hi all,

Can anyone recommend a good terminal program for the MFJ 1278B which
controls all its modes including SSTV?

I bought Multicom 3.11 but find it lousy.
I also dislike the fact that multicom only allow 2 installs, I already have
lost one install due to HDD failure.

Any suggestions would be a great help.

Thanks.

Why does it exhibit a long latency or better yet, where can I read about the device? The latency should not be too much of a problem as long as the transfer rate to the modem is fast. Basically, most commercial OSs can't deal with low speed to targeted point, but can handle delays. It comes from the industry's metropolitan-car-driver take on the internet, see how fast we can slow down.

Many applications are already configured to handle pipelining to make use of high bandwidth but slow turn around time.

Later,

Message-ID: <34B54B3E.3B01E2FA@eos.ncsu.edu>
Source record: 26156

```
-------------------------
Sec. 97.119 Station identification.

(5) By a CW or phone emission during SS emission transmission on a
narrow bandwidth frequency segment. Alternatively, by the changing of
one or more parameters of the mission so that a conventional CW or phone
emission receiver can be used to determine the station call sign.
-------------------------

Except for this rule, it looks a lot better for SS now.

Want this still limit us to the same restrictions as non-SS? Or will
everyone just say we did and everyone transmits their warning all on the
same frequency, regardless of if some one else is also giving out a
warning? Would the FCC care if that happened?

Another scenario would be to transmit the warning at 1uW, I guess.

Any takes?

Pearce

>about. Build your local high speed *radio* network, then build some
>*radio* links to the next area where there is tcp/ip activity, etc.
>There should be enough technological challenge there to keep you or
>anyone else going for several lifetimes!

3 problems:
1) Money
2) Time
3) Money

I am taking 5 A Levels, am at school (Monday to Saturday), so
haven't got loads of time. Money - on pocket money plus the little I
earn as a web page publisher, minus that for driving lessons, not
very much to invest in equipment.

However, my group is putting the final touches to a Super-
hub/LAP network scheme that should prove to the AX25 lot WHY
TCP/IP is worth the effort.

And the link to Gloucestershire and Bristol is still only a basic plan
because of the fact that there is little cooperation with node sysops
to use IP friendly firmware such as X1J. Can be done, you
understand, but where there no will, there's no way....

I don't understand. What is the meaning of the "if someone else is also giving out a warning" in this case?

If I read this correctly, the FCC is just asking for a CW or Phone ID, why not just automate the system to tack on to the end of each transmission a quick cw ID? (I don't exactly know how I would do this just yet, but I presume it is reasonably simple.)

I am not yet on SS, but hope to be and want to be clear as to the rules.

Thanks for clarification! 73, DavidC AA1FA

FWIW:

A well written TCP/IP stack should be able to handle the long latencies. Wireless connections are inherently high latency. If the IPers are whining about latency over these type off networks, then they should be figuring out how to tolerate the latency, instead of whining.

However, I am not a proponent of doing IP over these type of links. There are far better ways of handling traffic over these wireless links. IMHO, while TCP/IP over wireless is cool (if properly implemented), it is not the answer to all problems.

My belief is the amateur HF network is for message-based traffic. I define message-based traffic as message units. These can be in the form of BBS, APRS, ect. It should be used for getting these information messgae units around long distances.

I like the idea of a whole network HF/VHF/UHF being totally wireless. TCP/Ip has a place in it at the LAN level, but not at the long haul level. ANd it should not be the only LAN level protocol. Nothing wrong with AX.25 for simple messaging. (I include BBS's as a subset of messaging.) Implement gateways to get those messages back and forth. HTML can be abstracted and packaged to be transfered over non-IP networks.

Some of the best commercial packet networks do not use IP. Some of them do.

Now I have been guilty of being a so called "Land Line Lid". I helped implement a natiowide comercial wireless IP wan, that used LandLine for basestation interconnect and backhaul. It had it's place. I also have used TCP/IP amateur networks that use LandLine for intersite connection. And there is a place for them.

But at the sametime, I like the APRS VHF/HF net, totally wireless. Real neat. I see talk of LandLine connections for it. THat I am NOT for. APRS was designed a complete wireless net. ANd it should keep evolving to do so. Packaging APRS info into message units to be sent over HF links is a great idea. Low overhead. (Yes, some sort of gate/converter needs to be done, but it can be done).

Anyway, some of you may agree with me, some may agree with a part of me, some may think I am smoking something good. But for a total wireless network we need to think of an abstracted model. IP cannot be used for everything, though it can play a part at the local level. I believe, and I might be naive, that what was intended in the first place. But landline connected IP radio links should not be part of the picture. THey should be standalone entities for those who want to do that sort of thing.

I usually don't join debates in this forum, but I wanted to bring a different approach to the subject in the form of practical discussion.

Thanks for reading.

That is an exact quote from a telegrapher of whom I asked the question
years ago. I imagine that he might not have known what he was talking
about.

> The sounder makes distinctly different sounds for key down
> and key up, so both the location and direction of the timing edges can
> be easily recovered. Any interval that begins with a key down click must
> be a voiced symbol, and any interval that begins with a key up clack must
> be an unvoiced symbol. Thus all 5 symbols used by Morse can be properly
> decoded via sounder.
>

I doubt many telegraphers did a scientific analysis of it, but for most
people I have known, what the guy said seems easier than your version.

By the way Gary, I've missed your posting here where you complain that
the Government is imposing a "subsidy" on hams in the form of an CW
test.
I guess you figured out that this supposed "subsidy" pales in comparison
to the FCC mandated "subsidy" being imposed on us all in the form
of HDTV which you support wholeheartedly.

But it still wouldn't be like being able to ping California servers from North Carolina, over the radio. However, with the current HF legal limitations, what you propose would be necessary if the long haul links are few and far between.

Since the situation is already worsened by the fact that we will have to work with a skeleton system, a restrictive routing scheme will be needed, so that only mail servers and packets addressed to talk daemons (determinable by examining the IP packet) may talk over long distance links, until link speeds improve. That way, the IP infrastructure can be built on what is already presently available, and later on when the higher speeds become available, we can open those links to unrestricted access by any node in the network, and the worst work will have already been done.

HTML could be requested and sent via mail until link speeds improve, but direct requests to httpd or http services would be blocked from passing through the router. Also, talk daemons could be constructed to operate more effeciently by sending a complete line at a time, guaranting nice, full, compressable text packets.

FTP would also be forced to operate the same way. Site contents could be requested by a command in a mail message, and sent back over mail, as well as files, like some systems on the internet still do. And even better, these sites could time outgoing files to times other than peak hours.

The final poker chip could be to remove AX25 from the long range links and replace it with a protocol that would allow us confirmation, and complete compression of EVERYTHING in the packet, excluding of course, packet length, compression method/dictionary, and error detection crc. As a matter of fact, the sequencing could also be moved into the compressed data area of the packet. Eventually the same protocol could replace AX25 in the LANS as old equipment dies.

I think its possible, folks. Any comments?

Sorry about the wording, it was the best thing I could think of. What I meant by that was the FCC is asking for a transmitted id detectable by a normal receiver, whether that means narrow band or modifying the SS transmission so that it can ID in a way detectable by normal receiver.

What I asked was, since I had thought this would cause a great delay in turn around time, was how do we handle it?

However, I had this idea that probably everyone else into SS already thought of, if you do tack a fast CW id to the end on a narrow band channel, it will not matter, as it will not affect the receiving stations comeback transmission. However, the flaw with this is that a narrow band channel would still be required to dump the id into. That still makes it tough for a station to reply quickly, as it must wait until whoever used it last has id'd. My question is that do we use loopholes like id-ing on the last frquency hopped to or maybe just id-ing all over each other in the narrow band channel or none of the above, just play the waiting game?

Coupling the computer noise into the receiver is a problem.
Here is an opto interface to help with reducing this. Also
keep the computer at least 15 feet away from your rig.
This is receive only. Add to it for transmit ability..

HAMCOM interface with optical isolation

Earlier in this thread, I tried to generate a thoughtful message regarding the problems faced by amateur packet radio. Among them was the thought that perhaps most of the problems faced by radio amateurs were in fact political, that the major reason the packet networks were falling apart was that people failed to cooperate.

I see from where this thread has taken itself, that I was in fact apparently 100% correct.

Sometimes I am really disenheartened by the attitude that many hams seem to have. There are a whole bunch of hams who like nothing better than to disparage the achievements and goals of others, because they do not jibe with what they consider the "True" way of pursuing amateur radio. Discussions rapidly turn into juvenile name calling matches, and our hobby and its desirability as a leisure time activity fades more and more.

Perhaps Kurt Vonnegut was correct about radio amateurs.

Sounds good to me. Where do I sign up?

It looks like we will end up doing something like that in order to comply with the letter of the law, in addition to what will be our REAL id via the same mode as the QSO. I think we ought to do both.

At 30 WPM, the ID will only take about 5 seconds or less anyway, and interference from our ID will be minimal I am thinking, and using one freq for ID from several SS channels shouldn't present a problem. Collisions will happen, but a good ID will get out sooner or later. We are not liable for interference making our ID unreadable anyway. We are resopnsible for identifying, not for ensuring that QRM does not prevent someone from copying it.

>quick cw ID? (I don't exactly know how I would do this just yet, but I
>presume it is reasonably simple.)

Realize that automatic Morse ID is required to be transmitted at a
speed of 20 WPM or slower. That would add 4 seconds to the end
of each packet under your proposal. In that same time, 93 kilobytes
could have been passed at the rate of a commonly used SS chipset.
And if 12 stations were active and using collision avoidance, IDing
would consume the entire channel time, leaving no time for data.
(IDing would have to use collision avoidance if it were to be readable
because Morse has no coding gain.)

What we can do, as the other poster alluded, is to designate one
narrowband channel for all stations to use for ID purposes, and
ID without regard for mutual interference. That would make that
channel a howling mass of garbage, of course, but technically
satisfies the archaic Morse ID requirement. There isn't anyone
left in the FCC CIB who can copy Morse anyway, so it doesn't
matter if the IDs are unreadable.

Considering the weak signal community's spurious objections to
SS, it would be poetic justice to choose the ID channel to be in
the middle of their segment. *Some* channel has to be sacrificed
in order to satisfy the FCC, why not one belonging to SS's most
vocal opponents? <evil grin>

But lets return to reality. We would not ID with every packet, but
only once every 10 minutes as is required by regulation. Otherwise
our throughput would be shot to hell by the 4 second extension of
every packet. So for 4 seconds every 10 minutes, one channel would
become howling garbage as everyone sends Morse in order to satisfy
the FCC. The rest of the time, we could proceed in a more rational
manner using embedded network addresses to identify individual
packets.

But the automatic power control requirement, which is basically
unworkable in an amateur radio context, means that we'll all de facto
be operating at 1 watt or less anyway (if that stays in the final rule).
So we can just operate under Part 15 without concern for the archaic
Morse ID requirement, or Part 97 content restrictions, or even licensing

requirements.

Given that de facto reality, and given the ARRL's vehement objection to the use of SS on VHF or HF (where SS's sharing ability would be really useful, and where Part 15 SS operation isn't allowed), no one in their right mind would cripple their upper UHF SS system to comply with Part 97 when they can operate it unfettered under Part 15.

And frankly, at upper UHF where we have empty bandwidth to burn anyway, there's no real point to bothering with SS. We can simply use wideband FSK (Slovenian style) for point to point links. Then we can use legal limit amateur power if we like (or more realistically, highly directional antennas), and don't have to worry about Morse IDs since we can use the call signs embedded in AX25 legally to meet the ID requirement.

The only thing useful that SS brings to the table at upper UHF is improved multipath resistance, but that's primarily of interest only to mobile stations. Given the sparse nature of amateur operations, IE there isn't a cell tower on every corner, directional antennas and higher power are required for amateur operation at upper UHF if we want to be able to operate further than we can spit.

The proposed SS automatic power control rule de facto prevents use of higher power, and the de facto requirement for directional antennas is difficult at best to meet in a mobile environment. So there isn't likely to be much interest in mobile amateur SS operation at upper UHF.

If the APC requirement weren't there, and if we could operate SS at VHF, then there would be a strong case for mobile SS usage. But we can't operate SS at VHF, and the APC requirement is in the proposed rules, so there's little reason to believe SS will find much mobile application. And for fixed point to point at upper UHF we don't need SS. So I don't see much future for amateur SS in the current or proposed regulatory environment of Part 97. It doesn't offer us anything we can't do either under Part 15 with fewer restrictions, or by using wideband FSK point to point systems under Part 97.

That's easy, you make a CW beacon and use it to continuously broadcast
an ID (set it for 20 WPM). Then leave your SS radio alone.

All sorts of things are possible, incuding the ideas you outlined.

A more important question would be "Is it likely?"

Is this what the individuals who make up mainstream packet radio really want, or is it another "maybe someday" technical fantasy, (ala TAPR) with no relation to the realities we must work with every day?

Remember, it's not the theorists who build things.. Life is entirely too short for that.

My station is currently QRT. TexNet is experiencing problems in my local area, and I thought to take advantage of the outage by using this time to add a couple of sections to my tower. (Santa Ham brought me a couple of tower sections, and monster reference books on PERL and JAVA this year.)

The weather has not been good, and I have to be very careful since I do all the work myself. I'd rather be off the air a few days than get into a big hurry and get hurt. It takes five minutes for me to put on my climbing belt and get to work. It takes hours, sometimes days to arrainge an antenna party when you live this far out in the sticks.

Naturally I hate to be off the air after five years of continuous operation. It's one of those deals where you go ahead and break a few eggs, looking forward to the omelet you'll end up with.

I've been wanting to switch over to FlexNet, but decided that a good signal was more important so I'm seeing to that first.

That's entirely true. You have seen the quote of Greg Jones of TAPR talking about "routing around" high-speed terrestrial networks (such as TexNet) with Internet links on a national basis. They should know better, but hams do tend to believe what the president of TAPR says. As a result, many potential node-ops have abandoned their plans, rather than go to all of that effort just to be "routed around" by LandLine Lids. Greg has managed to dishearten many node ops who struggle to maintain existing systems as well.

One serious political problem we face is incompetent "leadership". Gerg's statements are about as non-cooperative and politically motivated as you can get. He knew what he was doing.

>have. There are a whole bunch of hams who like nothing better than to
>disparage the achievements and goals of others, because they do not jibe
>with what they consider the "True" way of pursuing amateur radio.

Horse-hockey. You can pretend that an Internet link is amateur radio if you like, but most hams prefer to stick with reality.

>Discussions rapidly turn into juvenile name calling matches, and our hobby
and its
>desirability as a leisure time activity fades more and more.

Once again you have become confused... This discussion is NOT amateur radio. It's an Internet discussion group.

You are really having a problem differentiating between Amateur Radio and the Internet, aren't you?

>Perhaps Kurt Vonnegut was correct about radio amateurs.

How long was Kurt a ham, I wonder? There seems to be a lot of misconceptions concerning Amateur Radio by Non-Hams. Have you noticed?

Maybe I am taking this out of context with the old rules but, item g of 97.311
says:

(g) The transmitter power must not exceed 100 W.

I had thought this meant that the auto power control had been eliminated. As that
a correct assumption or this just a additive to the first rules concerning SS?

Sincerely,

David

The ACC RC-85 and many other repeater controllers can send the standard
two-tone paging sequences if you enter specific touchtone commands.
You can easily recrystal pagers like the motorola spirit from 15x.xxx to
the ham 2m band.
Kinda neat if you have an ARES or RACES repeater, and have some non-ham
volunteers that need to be informed. you can page them...

Could it be that he has mistaken a "bug" for a key with make and break
contacts? I hope that everyone remembers that the old landline telegraph
system depended upon a complete circuit. There was a switch on the key
that shorted the key unless you were sending. One open switch opened the
whole circuit. That operator had to either send or close the circuit so
that someone elxe could send. Thus when no one was sending, the rest
condition was with the sounder down. The exact same system was used in
land line teletype. Current running through the coils held the clutch so
that the printer did not print. When the line went open the printer
started running continuously.

It will be interesting to see how HDTV develops. Congress is saying that this is a terrible give away of frequencies which are worth unimaginable amounts of money. The broadcaster sees this as meaning that he has to spend an enormous sum to buy all new equipment, build a new tower and so on. Actually if the system does develop, there will be the same number of channels when the present broadcasting system ends. The channels are only expensive when they are scarce. Recent auctions have only brought yawns from potential biders.

Looking at Japan where a form of analog HDTV has been in operation for years, the number of sets sold has been so small as to be silly. No one knows if the same thing will happen in the United States. TV audiences are shrinking each year and I think that few people will be willing to pay $5000 to watch laxitive ads in vivid true to life HDTV. When I point this out to people who are still in the TV business, they say, "Everyone knows Moore's Law that says semiconductor prices will drop ...". Yes, but the display end of the set, the picture tube is where much of the money lies and I don't see any magic answer to putting a HDTV display in everyone's living room at amything like a reasonable price.

In addition to the cost, there is very little information about the broadcaster's service area. Analog tv fails gracefully as the signal strength decreases. Digital tv will either produce a good picture or no picture with very little in between. If the broadcaster's service area is greatly reduced, his profit picture will also be reduced.

My guess and it is only a guess is that there will be so little interest in HDTV that congress will ask the FCC to drop the whole thing and we will still have NTSC for even more generations.

Best regards,

Art Borg

: the problems faced by amateur packet radio. Among them was the thought
: that perhaps most of the problems faced by radio amateurs were in fact
: political, that the major reason the packet networks were falling apart was
: that people failed to cooperate.

I believe this is accurate, that the core problems were and continue
to be political/social. Regrettably, certain sectors appear compelled
to continue fighting the destructive "protocol wars" of the 80s to
further today's agendas, ones that are completely disconnected from
the somewhat justifiable raison de guerre of the first battles.

It seems impossible to get away from these talent and energy
dissipating conflicts. It's funny and sad, at the same time.

Some problems just aren't susceptible to engineering solutions.
Network building is probably one of those that aren't. Strategies to
address the relationship problems in network building are needed much
more than is yet another box of technical band aids.

: Perhaps Kurt Vonnegut was correct about radio amateurs.

What did he say?

No, Art... these were both straight keys. I do know the difference between a
bug and a straight key as I build and use both. They were not sideswipers
either if that is your next question. I think maybe Gary had the answer when
he mentioned FSK, and that seems the best explanation so far.

I have never seen one of the old camelback keys, except in a photograph, but I
seem to recall that it also had two sets of contacts.

I like your input, though. I have never done RTTY without a computer or of
course Morse that was not CW and this is all pretty fascinating.

>

HAMCOM interface with optical isolation

Sorry... your ascii drawing lost a lot in the translation between your system font, the ng, and my font. The spacing got really trashed and it is a jumble on my screen. I tried this before myself, posting an ascii drawing on the ng with similar results reported by others, though when I read it on my machine it was just fine.

It is a bother, but I now post small drawings as GIF files or other graphics formats. Text only approach does not always work so good.

Still, good idea using opto-isolators or ddiscrete component equivelants. I have been meaning to do this but just been too lazy. The op-amp filter works great for 75 Hz shift, where even a 500 Hz IF filter is just a hair wide. I usually don't do this since an external power source is called for, but the computer I have now won't even support the plain vanilla circuit with a TLO82, so I an going to go with external power anyway. I will probably incorporate both add-ons, and maybe active filtering of the TXD output instead of all the passive stuff which is rather clunky and has a bad trade-off between flexibility and effectiveness. If I ever get around to doing it the RIGHT way for a change, I'll post the schematic of what I end up with.

If a builder doesn't mind approaching a small TNC in size and power consumption, performance should approach that of a simple TNC. A complete device could be sold for under a hundred bucks, I think, and the Hamcomm -type programs might experience a surge in popularity. This in turn might lead to shareware release of a decent Pactor program for the device.

I am really glad to see all these postings on Hamcomm, the hardware, and related programs. I really like the setup for casual ragchewing which is the only kind I do, and for having some "gee-whiz" stuff that is obviously homebrewed and simple to make to show a new or wannabe ham.

Now If I can just find my active filter notebook......

>not one belonging to SS's most vocal opponents? <evil grin>

I like your other ideas and they mesh pretty well with my own on this topic, but I have to say the above snip might not be a good idea. It is too close to being "malicious interference" for my taste.

The ID channel will only have to be about 50 Hz wide and can easily be straddled by the SS channel or a group of channels. I agree that there is no particular need to ensure readability of the ID as long as it would have been readable were there no QRM from other IDs. The REAL ID would be in the SS stream and the CW ID is strictly for letter of the law compliance.

Maybe if the ID channel gets too ridiculous, we can petition the FCC to drop this rather senseless requirement at a later date, when and if SS gets popular.

Has anybody got a good source for current proposed protocols for SS? I would like to get my hands on nuts and bolts details about how it is to be implemented.

229. no code low self esteem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-09 00:00:00 UTC
From: 8TJM@CONCENTRIC.NET
Message-ID: <884368402.213778439@dejanews.com>
Source record: 26096

.... You know.. it comes out loud and clear.. the no code
boys and no code supporters really feel left out of ham'
radio... it is clear they suffer from low self esteem...

I mean just look at the comments they make...

Ham radio is a caste system... meaning they feel excluded.
Technical discussions are *elitist*..meaning if they don't
understand the topic
they feel left out...

This low self esteem can go a long way to hurt someone
internally and externally.. but like all such issues
this is no different.. this low self esteem is self -
inflicted...do to THEIR UNDERLYING KNOWLEDGE THAT THEY
DIDN'T PASS AS DIFFICULT A TEST AS OTHER HAMS BUT WANT TO
BE TREATED AND RESPECTED LIKE ALL HAMS.. WITHOUT EARNING
SUCH RESPECT...

NOW low self esteem can be dealt with.. but when it is
combined with a pompous attitude that they *know what
is best for ham radio* and that *they should not have to
learn what they don't want to learn..* it is clear..that
good ole Sigmund F. would be hard pressed to diagnose
this problem correctly... maybe he would say..... its

MIC ENVEY.
8TT .. NOT A MEMEBER OF N.C.I.
I LIKE TO EARN AND WORK FOR WHAT I GET.

It's Brian here... Sorry to take so long to show up...

>>Runs under win95 ?
Please note that FTV is not a Windows program.
It runs under Win95, as a DOS program, if Direct-X (from Microsoft) is
installed.
>>Autodetect soundcard ?
Yes, if card is SoundBlaster compatible.
If BLASTER environment variable is present, these will be used. If not,
AutoDetection will be used.
>>Autotune ?
No, except for SSTV sync level.
>>Automatic mode-setting ?
Has Mode Analysis - determines if signal is FAX SSTV or COLOUR SSTV, selects
correct line rate. Does not have SSTV VIS code analysis. CW & RTTY speed &
format can also be analysed.
>
>Even on hi sweb site he offers few additional details. Says it'll
>handle x number of fax modes & SSTV modes, but neglects to say
>which ones. Offers the download of a "demonstration" package
>which implies that it isn't useful software at all. Never says
>anything about the cost of the software or how to get it.
>Mentions that orbital satellite decoding is available but doesn't
>mention whether image enhancement is included for the IR channel
>- a very dark sample image suggests that none is available.
>
Sorry for lack of details - it never occured to me. The Modes are not even
listed in the User's Manual - that is an awful blunder on my part.

Demo package is simply the unregistered package, which does not save images
and CW/RTTY logs. Cost is 25US$ (free for personal callers, but I do live on
an Island)

There is no automatic image enhancement, though it can be done upon request.
Explain what you need and I'll do it if within my competence. It is
relatively easy to fix such images, and an example is described in the
manual in tutorial style.

Thanks for the feedback... Let me know if you need more info :-)

There's no pretense about it. Packet radio is most useful as the
"last mile" provider. What happens beyond the first gateway is out
of the user's view and doesn't matter to him as long as it works.
He's using packet radio. His intranet is packet switched. What
the internets beyond the gateway are doing has no effect on that.
They could be using packet switched radio, they could be using
wirelines, they could even be using semaphores or smoke signals.
He doesn't know, and it doesn't matter. His operation is the same
in any case, except in respect to speed of realtime applications.

>>The days of RF forwarding are basically over. You can get a feed off
> ^^^^^^^^^^^^^
>
>You misspelled "packet RADIO."

No he didn't, he misspelled "message forwarding". Message forwarding
is a separate matter. That's not packet switched radio. Conceptually,
message forwarders could be snail mailing hard copy from BBS to BBS
and hand keying it in. From the point of view of a packet switched radio
user accessing the BBS, there is no difference. (And delivery might be
faster and more assured too, given the uncertainty of delivery of today's
message forwarding systems.) Message forwarding is an application layer
issue, it is not a physical layer issue or a link layer issue. It isn't even a
network layer or transport layer issue. And it most emphatically is not
packet switched radio.

And you'd do well to ask yourself *why* that's so. What do we know that you don't? What has allowed us to build a large fast network and keep it running smoothly for over a decade while you haven't?

Could it be because we've avoided the hangups about BBSs and message forwarding *applications* while concentrating on delivering fast and useful packet switched intranets and internets for our users? Could be. Does your packet switched network support web servers? Ours does. Does your packet switched network support digital audio and video? Ours does. Does your packet switched network support a gateway for worldwide internet access? Ours does. Etc.

We've been successful because we've laid an infrastructure that supports any application our users want to run. We haven't had wars about what constitutes "Real Ham" activity. We haven't let the tail wag the dog. We've just promised and delivered fast and accurate switched transmission of our users' packets across our network. What applications are served by those packets is our users' business, not ours. We don't install or run application servers. We just provide packet switched network services. That's *our* business, not our users' business. We've kept that line very sharp over the years. We had very good leadership in the early years who set it up that way. And we've had the good sense to keep it that way.

The ARRL has been extremely hostile to any attempt toward faster
digital operation on HF. They've fought attempts to raise the permissible
baud, they have fought to narrow the permissible occupied bandwidth
for automatic networks, and they've been extremely hostile to the idea
of SS on HF. They are the primary roadblock to faster HF operations.

Actually, a HF link *lowers* latency. What it lacks is *capacity*. By
jumping over a number of VHF+ hops, a HF link shortens latency
dramatically. But the low permissible speed of HF operation means

it offers little capacity to take advantage of that low latency. Thus it becomes a very constricting bottleneck for internetting various local intranets.

RM-8737 is the proposed new SS rule set. It includes an APC requirement for
all SS transmissions above 1 watt. The maximum limit would remain 100 watts,
but that's virtually moot since the impracticality of observing the APC requirement
in amateur use means we de facto will have to stay below 1 watt. Since we can
do SS under Part 15 if we stay below 1 watt, and since Part 15 doesn't burden
us with a Morse requirement or restrictive content requirements, the intelligent
thing to do is to just operate under Part 15.

Not necessarily in all cases though. Taking the law to its letter means
we do not have to meet a specific speed of auto power regulation. That
means we can incrementally alter the gain of the RF out amplifier based
on results from the last packet sent (like if it wasn't heard) and have
back off algorythms to keep from maintaining high continuous power. With
forward error placed into the equation, an even better picture of loss
could be had, from the data from the corrector that has to follow the
codes to put a sensible packet back together. We will need the higher
power for longer runs. This would also provide a neat way to view band
openings by perhaps making the control system telnettable or have it
make broadcasts every few minutes about the past activity.

To the SS experts, will <1 Watt buy us much distance?

Hmmmm...Since every member of the public is going to be forced to
purchase a very expensive all-new technology television to replace each
one currently in use, it's not the government but we individuals who
will foot the huge bill for HDTV. That's after all the mandated
extremely heavy investment by each and every braodcast station for all
new plant.
This marks the end of free off-air TV as we have always known it since
the beginning of TV broadcasting. Now *There's* something for you to
bitch about.
Yes, it's all-new technology, and surely a better picture will be
received by all. But I don't happen to believe the difference between
HDTV and the digital DSS system I now use will be anywhere near worth
the investment required. It has as good a picture as I want and would
willingly pay for, and I'm one who appreciates good video, having worked
as a TV broadcast engineer.

An audio bandpass filter will probably help you, but what you really need is
a good matched filter TU decoder if you want to work weak RTTY signals.
In other words, you want separate filters for mark and space setup to work
in tandem and feeding a smart slicer. Irv Hoff showed how to do this cheaply
in the early 60s using 88mH toroids, but you can use state variable opamp
filters, or DSP, instead. You can feed the output of such filters to the game
port of a PC, using it as an A/D converter, and implement soft slicing in
software. Even a PC XT can keep up with RTTY, so this isn't demanding
of computer resources. And it is a good programming exercise.

>73 EVRBDY DE AB5VH (Robinson)

I don't know the purpose of keys with both make and break contacts, unless it was intended for use with a FSK arc transmitter, but a sounder produces its differing sounds purely mechanically due to the spring constant and the construction of the mechanical stops at each end of its travel.

The make sound due to the pull of the electromagnet is sharper than the break sound due to the return spring. Thus the click-clack. This may be enhanced in some sounders by differing mountings for the stops. The term LID came from the practice of attaching a tobacco can lid to the break stop to make its sound more distinctive, but an ordinary sounder also produces a distinctively different sound on break than on make. It just isn't quite as pronounced as when you augment it with a lid.

(Rather than being a term of derision, LID should really be a complement to the technical savvy of those using primitive signal processing technique to enhance reception. But a segment of the Morse culture has always been disdainful of those attempting to make technical improvements. There is something atavistic about Morse operation which seems to bring this out in some people.)

>Grapes is the Georgia radio amateur packet experimentors society (or similar), to
>tell you the truth, I haven't seen the exact wording for it before, but that fits

Close. Georgia Radio Amateur Packet Enthusiasts' Society. GRAPES is the oldest,
if perhaps no longer the largest, packet radio group employing the WA4DSY 56 kb RF
modem technology (since 1986). There are a number of other groups around the world
today who also actively use the technology. Sales records for the modem indicate that
it is more popular among foreign amateurs than among American amateurs. That,
sadly, seems to be an indication of the stagnation of US packet radio.

But GRAPES isn't a technology. It is a "club of clubs". Its members are LANs.
Local areas form into LANs and are linked by the GRAPES backbone network.
Some of those links are 56 kb, some aren't. Our LANs trailed the Ottawa group
and the Chicago group in implementing duplex 56 kb LANs, but now we have two
of them in operation with a fair number of active users running 56 kb at home.
Of course, Dale is one of them. (LANs are responsible for their own intranets,
GRAPES only deals with internetting between LANs.)

We may have one of the few amateur radio packet switched networks in the
US capable of supporting modern applications such as websites, Real Audio,
and streaming video.

243. Gps ans HAM?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-10 00:00:00 UTC
From: bradley a hampton <bhampton@whidbey.net>
Message-ID: <34B795E4.339A598B@whidbey.net>
Source record: 26022

Hi my name is brad KC7MRP,
and I am interested in Gps,s and ham radio.

and I was thinking of a way to make a (local) differential GPS
transmiter.

it seems all oone would need is a GPS with a good antenna to collect the
data from the satelites connected to a computer which would compare that
"random location" with the true location of the site and generate a
correction factor then to a TNC and VHF or UHF transmiter.

the reason I did not include HF is that this type of system will only
correct for the position as a whole not by each satalite so the user
must see mostly the same satelites as the refferance station and the
error would go up with distance.

this system would porvide better positioning that the GPS system as it
is now, with the DOD induced error. but not as good as real coast
guard DGPS.

if any one has any thoughts on this. equipment considerations? other
things to consider with type of system? software?

another way may be possable is if some one was using APRS to send there
location and an operator knew there TRUE location he/she could use that
data to figure an error correction.
the APRS transmision would have to be almost continuious except for ID.
I plan to set up such a site as soon as I figure how to do it and a safe
freq to use I may look at 6meters 440 220 2m I would like to stay out
of the way but I don't want users to buy new riggs to receive the
signals.
thank you brad

"Poor man's DGPS" - Not worth wasting time on, it won't work unless
each receiver sees, uses, and weights the same SVs in the same way,
has the same noise profile, etc. Doubtful you'll be able to meet
the requirements.

A fellow from the Netherlands over in sci.geo.satellite-nav is looking
at ways to get per-SV corrections out of an inexpensive OEM board (the
rockwell zodiac I think). An efficient datalink for his system would
be very useful.

This advice is free. Refunds gladly given.

Saturday 01-10-98
Rocklin, CA 95677

Hello:

What is available (freeware/shareware/forsaleware/underwear) for the
following configuration :

radio - - TNC - - Win95 peecee

that has, at least, the following feature:

split screen, (and the ability to save incoming text
from receive window into text file)

The radio will be some VHF thing, the TNC will be TAPR II - like,
and the PC will be a IBM-like Win95 box.

Please respond directly to me, as I'm sure this question has been
asked (and answered) ten thousand trillion times before in this news
group... (I'm just a little slow on the uptake, and wasn't paying attention).

If you'd like to offer any opinions on the different packages, I'd really
appreciate your experiences, your preferences, and especially about
any packages that you hate (for what ever reason).

Thank you very much.

Yeah, there's not going to be a windfall for the government out of this thing
by selling vacated spectrum. Most of the vacated spectrum is going to be
low VHF anyway, and that's not very attractive to most of those hoping to
develop new wireless services. The government may receive a windfall
of another sort, however, in the form of sales taxes collected on all the
new sets that will have to be purchased, and income taxes on the profits
of those making and selling the sets. That's a tidy sum. And it'll have a
multiplier effect in the economy just as any other high tech boom does,
and that means even more tax proceeds for the government.

Japan didn't mandate a switch to HDTV. The US has mandated a switch
to DTV (note *not* HDTV). The cost of a DTV receiver should be no greater
than for a DSS receiver, less considering the economies of scale of replacing
300,000,000 sets over an 8 year period. HDTV sets will be more expensive
than plain DTV sets, but there won't be much HDTV programming to watch
in the early years of the changeover because there's no existing inventory
of HDTV material to fill the hours. HDTV receivers will be the province of
the videophile and the first adopter (and the rabid sports fan). And they are
free with their money.

It is worth noting, however, that Panasonic showed a large screen HDTV set
at CES which will go on sale this fall which *doesn't use a CRT*. They've finally
found a way to economically make large solid state displays (and Moore's law

does apply to them). People are going to want a large screen TV that they can hang on their wall, and getting HDTV capability in the bargain is just a bonus. I predict this will be a hot item next Christmas.

>In addition to the cost, there is very little information about the
>broadcaster's service area. Analog tv fails gracefully as the signal
>strength decreases. Digital tv will either produce a good picture or no
>picture with very little in between. If the broadcaster's service area
>is greatly reduced, his profit picture will also be reduced.

The FCC is aware of this, as are broadcasters. The OET developed the Longley-Rice model to predict DTV coverage contours and arranged allocations so that no station will have less than 97% coverage of its previous service area after it commences DTV transmission. The FCC has assured broadcasters that modifications to their DTV licenses will be permitted if field tests don't match the model during the 8 year phase in period. So there's no reason to believe that broadcasters will lose significant market penetration due to the switch to DTV.

And viewers will be assured of better pictures because of the all or nothing nature of DTV, IE no more snowy ghosty marginal pictures (which is what a *large* fraction of the current NTSC audience sees). The viewer will either have a perfect picture or no picture at all, and the overwhelming majority will have a perfect picture. Even a NTSC resolution picture is a glorious thing if you can get rid of the transmission artifacts of the analog system. And real HDTV is simply breathtaking. The jump is at least as big as the jump from B&W to color, and look how fast that happened.

>My guess and it is only a guess is that there will be so little interest
>in HDTV that congress will ask the FCC to drop the whole thing and we
>will still have NTSC for even more generations.

I don't think that has a snowball's chance of happening. The switch to DTV will happen. There's too much money involved for it not to happen. The phase in may stretch past 8 years, but it won't span across generations. The set makers see 300,000,000 sets to be sold. The broadcast equipment makers see $50,000,000 per station and production house to be made. The chipset makers see bundles to be made. The computer industry sees a huge bonanza as well because they'll get penetration of high res digitally driven displays in every home, and that opens the way for huge software sales. Etc.

They'll drive the changeover (if you want to know what Congress will do, just follow the money, and there are *huge* amounts of money involved here), The consumer will have to either buy the equipment or stop watching TV. I don't see the American public giving up watching TV. Realize that cable and other programming sources have to switch to DTV too. So there will be no option to continue using NTSC. You'll buy a DTV set or quit watching television. Tell your family that they can't watch TV anymore and see how well that goes over. Somehow I doubt they'll be content to return to books and magazines. You may have to put off buying that new car for another year, but you will buy a new TV.

Realize that the switchover to color from B&W was virtually complete in
8 years, and there was no mandate involved there, B&W sets still worked.
The price differential was about the same too (in constant dollars). I'm
convinced the changeover is going to happen pretty much on schedule.
I'll even predict you're going to see broadcasters petitioning to turn off
their power hungry NTSC analog transmitters early because DTV audience
penetration will warrant it.

Realize that there are only about 5,000,000 viewers, out of 260,000,000,
who are in that situation. Most broadcasters (and all cable operations)
have written off the very rural viewer already. He isn't counted in their
ADI, so he doesn't generate any revenue for them. If he wants a good
picture, he's stuck with satellite. But satellite TV will be DTV too, so
he'll still have to buy a new set. (And yeah, that means current DSS
receivers are going to be obsolete too.)

I have just purchased a 2nd hand Yaesu FT3000M for use on packet.
Using the 'data connector' on the rear panel to connect to the TNC, I
find that the the level of audio output is bearly audible and seldom
sufficient to be useable!

Can anyone guide me to a solution - maybe an internal pot adjust.

From: electron78@aol.com
Message-ID: <19980110185900.NAA22705@ladder02.news.aol.com>
Source record: 26032

I am looking at designing a transmitter and receiver to send and receive digital signals with QPSK modulation. My most humble question is: if my receiver has an I.F. of 100MHz, and the receiver is designed to receive a 25MHz wide bandwidth QPSK signal, what frequency should my LO (carrier re-insertion) signal that feeds the QPSK demodulator be run at? Or do I need some sort of complex carrier recovery circuits to demodulate with the demodulator? Or are these already built into modern QPSK or I/Q demodulators?

Did I forget to add "HELP!!!!"?

Thanks!

Mike

PS: The application engineers at some of the chip companies are almost useless with questions such as this, so they are of little help.

The way I read the regulation, we have to start at low power and retry
up to the point where we achieve communications while at the same
time keeping the power at the intended receiver below 23 db Eb/No
which we can NEVER exceed.

Now how the hell can we do that in a typical packet LAN environment?
Most of the time we'll wind up being a hidden terminal. And how do we
deal with multiple UDP packets being directed to and from multiple
stations, each requiring a different power level? There are no acknowledge
packets to report receive Eb/No to us. So we can't use UDP. And we must
maintain *state* about every other station to which we may need to
communicate. That goes against all the principles of good networking
practice.

Sure, having each station on its own unique code sequence gives us about
20 db of isolation, but that often won't be enough. CDMA codes aren't purely
orthogonal. There are going to be collisions. So we could exceed the maximum
Eb/No at the intended receiver and still not get a response to tell us we're too
strong because we got clobbered by the near/far problem. Presto, we're in
violation of the APC rule.

>To the SS experts, will <1 Watt buy us much distance?

Terrain willing, 10 to 20 miles. Terrain not willing, a few hundred feet.

In Ahoskie, NC, where my parents are receiving DSS, bad thunderstorms
are the routine. Signal strength get to be about 89% at its worst, while
it typically receives at 93% signal strength (the on screen bar graph).
I have actually never seen the signal fluctuate to the point where it
became unwatcheable, besides once in a snow storm where the dish became
half filled with snow, and the LNB was fully frozen with ice. Evidently
the ice blocked the signal to the point where the dimished focusing
power of the dish became insuffecient.

So, because they did specify the direction we find the power output and
the max ratio, we are stuck with a complicated mess.

>

SOunds like the FCC has stuck HAMS with only one solution for either
problem, lots of money. Why does the FCC want to limit the ARS's foray
into SS so badly anyway? Hasn't SS been proven in military and
commercial applications to not cause meaningful interference? That was
my understanding anyway.

Well, to start with, you have a much larger concentration of hams per
square mile than anywhere in the Intermountain area. A larger user
base gives you a much better chance of making something work. The
only spot in the PNW that really has a large concentration of hams is
in the Puget Sound area, and they're so good at infighting that they
can't even maintain a decent link over the Cascades into Eastern
Washington. I dunno how it is in Four-land, but out here in the West,
folks are sort of independent and cantankerous. Getting any three of
them to agree on anything is not a trivial task.

>Could it be because we've avoided the hangups about BBSs and message

No, it's because you've avoided or bypassed political squabbling.

>That's *our* business, not our users' business. We've kept that line very

>sharp over the years. We had very good leadership in the early years who
>set it up that way. And we've had the good sense to keep it that way.

I beg to differ. If you've been successful, it's because you've had a few folks who are dedicated enough to start a project and stick with it for more than a few weeks, months, or years. It's because you've been able to avoid or, more likely, to bypass political squabbles. I applaud your ability to do this, but I suggest that the technology you're using is far less important than the fact you've been able to avoid being shot down by ego trips, either inside your organization, or competing with it.

Bottom line, however, is that you did it "your way." Dissenters can play, or leave, just like anywhere else.

Somebody in your group has some rare and outstanding "people skills," I'm guessing. In any volunteer organization, this is much more important than technological skills. Among hams, diplomacy is a rare thing indeed.

>From: DK4NB @ DB0AAB.#BAY.DEU.EU
>To : SOFTWARE @ WW

This is the documentation for the so-called #BIN# protocol, a
procedure
for transferring binary and other data files without undue overhead.

0) REVISION LOG

31 May 94 First published.

1) HISTORY

The original #BIN# protocol was probably devised by DL1BHO for use
with
his TurboPacket program. The protocol underwent a number of changes
and
improvements at the hands of ex-DL1MEN who is now DK4NB. The #BIN#
protocol is implemented in most packet terminal programs utilizing the
WA8DED host mode, such as TurboPacket, TOP, GP, SP and others, as well
as the F6FBB and TheBox BBS software.

As of today (June 1994), the most recent version of the #BIN# protocol
is
only available in SP version 9. It is hoped that this version is
adopted
by other packet terminal programs. Due to its very low overhead, it is
a natural for replacing the obsolete YAPP protocol.

2) PROTOCOL DESCRIPTION

2.1) BASIC

The basic #BIN# protocol consists of three elements:

The station transmitting the file (from now on called STATION A)
transmits
#BIN#nnnnn\r
and the station receiving the file (from now on called STATION B)
transmits
#OK#\r
in positive response, or
#NO#...\r
in negative response.

"nnnnn" = the length of the file in decimal bytes
"\r" = a RETURN character
"..." = any explanatory text as to why the file transfer is
rejected.

STATION B is to ignore any data not beginning with #OK# or #NO#.

All Elements are to start at the beginning of a frame and be contained
entirely within one frame. The frame immediately preceding an element
is to end with a return ("\r").

A transfer is aborted in midstream by one of the stations transmitting
\r#ABORT#\r

2.2) EXTENDED

The extended #BIN# protocol has last been changed in January 1994 and
is
described as follows:

STATION A transmits:

#BIN#nnnnn#|ccccc#$dddddddd?#ssss\r
----- ----- -------- ----
! ! ! file name without path
! ! file date and time in 'struct ftime' format
(BCC 3.x)
! ! in hexadecimal notation (32 bits)
! The CRC of the whole file in decimal. Standard CCITT
! polynomial.
file length in decimal bytes.

The negative response by STATION B is defined as above. The positive
response
may be
#OK#\r (1)
or
#OK#ssss\r (2)
or

#OK#ssss#$nnnnn#ccccc\r (3)
---- ----- -----
! ! CRC of received file fragment
! number of bytes in received fragment
file name without path

Case (1) and case (2) are treated identically. Currently, the #OK#
file name
is transmitted for information to the operator only, since the
receiving
side is free to choose any file name.

Case (3) is the response used if it had previously been attempted to
transfer
the file, and the transfer has failed due to a manual abort or a
broken
link, or a disconnect. Note that when aborting, it is the
responsibility
of the receiving station not to allow any extraneous information, such
as
digipeater status messages or the #ABORT# command or TNC status
messages
or any other data not belonging to the received file to be stored. If
the
receiving station cannot guarantee this, it should delete the file
fragment.

When STATION A re-transmits the same file, STATION B should check for
existence of a previously stored file fragment. If there is a
fragment,
then the data according to (3) should be determined and the
appropriate
#OK# message should be transmitted.

The method of identifying a file fragment is up to the protocol
implementation. In the case of SP, the file extension contains a "$"
in place
of the first character, e.g. "TEST.LZH" generates a fragment called
"TEST.$ZH". Better operating systems than MS-DOS allow long file names
which
could be used to better denote a fragment.

STATION A, upon receiving the #OK# according to (1) or (2), should
commence
transmission of the file. The logical conclusion of the file transfer
is
achieved with the transmission of the last byte of the file. Upon
receiving #OK# according to (3), STATION A should determine the CRC of
the
fragment and compare it with the CRC reported. Appropriate measures
must be
taken if the CRCs do not match.

2.3) OPERATOR CHAT

While STATION A is in binary transfer mode (i.e. not all bytes of the file
have been committed to the TNC yet), the user is allowed to transmit textual
data not related to the binary transfer. All frames of such data must be
preceded by the string
SP\-
and STATION B must not regard frames starting with this string as parts
of the binary file transfer. This allows the operators to chat while
transferring the file. STATION B, when transmitting data, need not take
any precautions. STATION A must not cause an abort when receiving any
data from STATION B that does not consist of the special abort element
described above.

2.4) INABILITY TO RESUME

If STATION A is unable to resume an aborted binary transfer, it should
signal this to STATION B at the start of the transfer by not transmitting
the question mark ("?") shown in the #BIN# element above. If this question
mark is missing, STATION B is to take whatever measures required to
either reject the transfer or to quietly overwrite the fragment.

If STATION B is unable to resume an aborted binary transfer, it should
delete aborted file fragments or take whatever steps necessary to not cause
an error message should STATION A repeat the transfer attempt.

2.5) CRC ERRORS

If, at the end of a transfer, STATION B detects a CRC error, it should
report this to STATION A and take whatever steps required (e.g. delete the
damaged file). The format of this report may be of any kind, since it is
not used by the protocol.

2.6) SUCCESS

STATION B should, at the end of a successful transfer, transmit a success
message to STATION A. It is recommended that STATION A send one to STATION B
as well. Neither message will be part of the protocol specification.
Provisions should be made to transmit success messages on a per CALL SIGN
basis, so as to not send such messages to BBS systems, which might be
confused and report invalid commands. Success messages only make sense

when
transmitted to a human operator.

3) AUTOMATIC #BIN#

Under certain circumstances, STATION B should react to the #BIN#
element
even if it has not been placed in binary mode. An example would be the
reception of a binary file from a TheBox BBS, which simply sends the
##BIN# element immediately followed by data. Normal procedure,
however,
calls for some other means of initiation.

A second use for automatic #BIN# would be consecutive transmission of
multiple files. The list of files is to be controleld by STATION A,
and
STATION B must be in a mode which allows automatic responses to #BIN#.
The protocol does not allow auto resume with automatic #BIN#.

4) INITIATION OF A BINARY TRANSFER

A binary transfer may be initiated at the programmer's discretion.
Usually,
this will be a command issued by one of the two stations involved.

A typical constellation is a packet user controlling an unattended
station.
That unattended station should place the appropriate commands at the
remote
user's disposal. Implementation of such remote commands depends on
factors
such as the programmer's fancy or the general purpose of the station
to be
controlled and their description is beyond the scope of this document.

5) FURTHER INFORMATION, CHANGE PROPOSALS

All communication regarding the Extended #BIN# Protocol is to be
directed
to the author, DK4NB @ DB0AAB.DEU.EU or Compuserve 100346,2236
(Internet 100346.2236@composerve.com).

This specification is subject to change without prior notice. Any
changes
will be published. Anyone making changes to this protocol
specification
does so at their own risk.

6) CRC ROUTINE

The follwong C code consists of the standard CRC table and a macro
used
to access the table.

```
/*
* crctab calculated by Mark G. Mendel, Network Systems
Corporation
*/
unsigned short crctab[256] = {
0x0000,0x1021,0x2042,0x3063,0x4084,0x50a5,0x60c6,0x70e7,

262. Re: EMI from Kantronics KPC-2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-10 00:00:00 UTC
From: nlav8r@aol.com
Message-ID: <19980110233800.SAA03659@ladder01.news.aol.com>
Source record: 26041

Perhaps it will be possible to move the interference away from the packet freq you use by replacing the capacitor in parallel or series with the crystal with a lower value.
I did this with a PK-88 TNC. Although there was still interference ,the offendeding sig moved outside the 2m ham band ie from 144.850 to 143.750 MHz .
I do have a KPC-2 + manual ,but not at my current location . If you need more assistance you can e-mail me at : gm0csz.kn6wh@ukrs.org

263. Java Serial Module

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-10 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <698sgt$4fe@snews2.zippo.com>
Source record: 26042

I'm drawing some blocks on a piece of paper here, and maybe
someones already designed this.

What I want to do is encapsulate the serial port in a socket
interface. That is, the serial port can be either local or remote,
and the data (kiss probably) be transported via TCP or UDP to
another machine, or even the loopback port.

One of the nice things I like about Java (and Perl for that matter)
is it's easy network programming. On a par with Unix. My Unix box
has a 16 port serial card that is now obsolete (I upgraded to a fire-
sale Cisco), and would be a good candidate for hooking TNC's up
to and make each of them available through a set of socket ports.
My thinking is that the serial port timing would be slow.

My other alternative, is to use the JNOS or TNOS base code all the
way up past the AX.25 level, and then provide a socket interface to
that for Java (basically it would be IP packets).

I guess this is to save writing the whole thing over. My first thought
was to use Java Native Methods, and use available serial code in
C, and then do the AX.25 in Java. But I feel the usefulness of AX.25
is probably not worth the effort. Anyone working on an AX.25 Java
module? The reason I say that, is the number of DSP type data
protocols (some just producing data packets--no routing), and the
recent SLIP TNC code, as well as future SS radios that will output
pure IP, thus obsoleting AX.25 pretty much.

Steve

>than I expected for cross country travel.

OK, TexNet is recovered, my BBS is back up, and there was only one personal message, from a VE3 call.

If you entered your message at an amprnet station, that would go far in explaining nondelivery. And, as has been noted, many of the Internet forwarders play the "Lockout Lid" game as well.

Try again, if it's important to you.

from http://info.eu.net/ftp/documents/faq/books/kurt-vonnegut-faq :

4. Is he on the net? Does he read this newsgroup?

Perhaps in keeping with his take on technology as presented in "Player
Piano" and others of his novels, Kurt doesn't seem to be at all into
"this internet thing." Not completely unexpected, really. Thanks
to our own John Dinsmore, though, he has read this FAQ (version 2.0,) and
had this to say about it, in a letter dated Nov 5, 1995:

"The internet stuff is spooky. I am of course not on line.
I do remember ham radio operators though, usually in attics or
basements, pallid, unsociable, and obsessed, inhabiting a

spirit world, and harmless."

Way off. Doesn't sound like me at all. Nope. Nuh-uh. No way.
My computer is in a room on the *ground floor*, thank you very much!

Now, of course, we'll have an argument about to what extent Vonnegut
was right. Or can we possibly avoid one? *sigh*

But receiving DSS under good conditions is hardly the same for the millions of people who live in rural areas a long way from the transmitter. Are they going to get any usable signal at all? If they cannot, they won't buy! That is quite simple. Would you pay a lot more money for a really sharp picture? That is where most of the cost lies.

Some years ago I was in charge of a design group that was designing Ku band satellite receivers. At that time the only satellite that you could receive here was a Japanese satellite. The Japanese were using a digital audio system. Since the company had the authority to sell receivers locally, I put one engineer to work on a receiver that would decode the digital audio and thus be saleable here. When he got done, it was really amazing. It sounded like the cute lady news reader was whispering the news right into your ear. It was hard to believe TV sound that sounded so good. Much the same effect as the visual aspects of HDTV. However, would I pay a premium for the same old news? Not much.

By the way, how does your DSS system work during a heavy rain storm? Unless you have a very strong signal, the path attenuation really goes up during a thunderstorm. We had to shut down final inspection because we couldn't receive the satellite. The present system required some minor retooling in the late 1940's because things turned up that had not been seen even though there had been broadcasting from about 1936 to the end of 1941. Everyone remembers the RCA 630TS as the prototype of commercial receivers for decades. The set had no AGC. The contrast

control was an RF gain control because common knowledge at the time said that VHF signals were not subject to signal fluctations. Improving AGC systems to minimize airplane flutter was still a problem in the 1960's.

Best regards,

Art Borg

> Not with GSM (the system used in Portugal).

GSM isn't used just in Portugal, bot all over Europe, as well as in small parts of North America (Washington D.C. has a GSM cellular phone network for instance), and several countries on the Far East.

GSM is a digital cellular phone system which in addition encrypts the voice data to ensure privacy. Sure, you could receive those signals on any receiver operating at the proper frequency (around 900 MHz -- soon a new GSM band around 1800 MHz will be used too), but it would sound mostly like noise, and you would be unable to make anything out of it.

Cellular phone systems which can be tapped by radio receivers are older systems, which uses e.g. normal FM for voice transmission. In Scandinavia, for instance, the older NMT cellular phone system can easily be tapped, and so can various kinds of DECT (= "wireless phones") phone equipment - all that's needed is a radio capable of receiving the right frequency bands.

It works great, no noticeable difference at all. A few days back we
had one (1) inch of rain falling per hour here in Atlanta. I turned
the set on to see what effect the rain was having, none!!

I have the new Sony 3rd Generation AD3, that might make the
difference? And i am getting Direct-TV and USSB. My signal strength is
about 85-87/100.

>network (still slow by European standards)... but I know that most of the
>traffic appearing there comes from wireline links.

Sorry to hear that. I hope you can eliminate the wireline links and return
to utilizing amateur radio links. After all, they don't call what we do
"Amateur Telephone", do they? Hopefully the hams in your area can get with
the program soon.

>My co-sysop team routinely deletes messages addressed to "sysop"... as they
>are mostly rantings of a few stubborn hams. Let's face it, our hobby is not
>attracting that much new blood. We have a *serious competitor* in the

>display totally useless traffic and flame messages. A real turn-off for
>these people.

Well, eliminating all communication from other SYSOPs will certainly put you
into a protective bubble, won't it?
Let's see... What sort of "Ham" can generally be counted on to insulate and
isolate himself from the mainstream of amateur packet radio? -- I think I
smell a LandLine Lid!

The inability to differentiate between one message and another (by reading
titles) is amazing. Most SYSOPs I know have no trouble whatsoever in
knowing which messages are good examples of packet traffic, and which are
not.
My theory is that this guy is not REALLY as stupid as he would have us
believe in this respect, but rather made himself look that way with a poorly
crafted attempt to run down the packet network by disparaging the content of
ham's messages and bulletins. - Another clue that the OM is a LandLine Lid.

Running down the amateur packet net is very common among the "Amateur
Telephone"
operators.

>
>In Europe, they have been using 56k packet for several years now, and
>*experimenting* is still a plus.

That's true. They don't have a big LandLine Lid problem over there, because
in many places it is simply illegal and in others it is not very widely
tolerated. - They would much rather work with radios, and so have made

progress while we have not.

>We have to *stop bitching* about cross-platform messaging and accept it as
>a fact of technology.

Radio technology? I don't think so, buddy.

We have to "stop tolerating" cross-platform messaging from non-hams and
non-ham links, and accept that utilizing the telephone (Internet) in
preference over radios for our communications is NOT a advance in radio
technology, but rather a drag on the development and utilization of radio
technology.
If you don't USE radio, you cannot advance or implement it's use very well,
can you? Wise up.

>Ok... I have heard about the following argument : What
>happens in a national crisis when the PSTN is out ??? We need our radio
>backbone !!!
>Hey guys, reality check !!! There exists a vast number of alternate paths
>(satcom, etc.) available.

So your message is "to hell with emergency communications using radios"...
Yep, I smell a LandLine Lid allright. A real "ham among hams", isn't he?

>In addition, during such a major crisis, won't we
>be taking care of our families first ? I have a fully deployable packet

>
>Packet-BBS systems are on the decline as internet usage increases... *we*
>need to be creative and introduce new challenges (such as high-speed HF
>data links... @2000bps+... it exists now in Europe with CLOVER-2000 modems.
>Our FCC doesn't permit it *yet*, due to bandwidth restrictions for HF
data).
>The APRS balloon will burst and there needs to be something new.

APRS is here to stay, but I agree that it's been over-hyped a bit. (Not
much though, compared to it's underutilization problem. The two go
hand-in-hand.)

The challenge of amateur radio is to achieve what you can *with radios*. There's a lot of work to be done on all bands, particularly the HF bands which have been grossly underutilized. Abandoning radio in order to move amateur radio communications over a LandLine network is NOT the way to encourage better utilization of radios on ANY band. Figure that out and you'll at least have yourself pointed in a useful direction.

There is no shortage of things we can do. Our problem is one of confused goals and short-circuited motivation. Along with deliberate attempts to disrupt or destroy the hobby, in part by by persons who by some odd coincidence also have jobs working for commercial communications outfits who would stand to benefit when hams lose spectrum.

REPLY...

I only mentioned Portugal because that was where the original message came from (and where GSM was first mentioned). However, I was not aware that GSM had spread so far around Europe and the US.

The point I was trying to make in my message was that I had heard that some phones, and some repeaters, were still not digital, or encrypted, on some GSM systems (or at least that is what I have heard).

With luck, he might be able to hear these with a regular radio with the right frequencies (assuming such a repeater is nearby), but it would be very limited because most of the signals, on even those repeaters, would be digital and encrypted.

Of course, I could be wrong. All I have is second-hand information from a radio buddy in Germany (I am heading there soon, so have been digging for info about this type of stuff).

>packet switched radio.

As usual, you insist on ignoring the forest while concentrating on the
trees. No matter how you sugar-coat it, use of the Internet does NOT
involve ham radio. Now, we can argue the definitions and usages of
the words until the cows come home, but the facts are not changed.

Perhaps Internet links are the way to go; I don't pretend to have the
ability to read the tea leaves and see what the ultimate result of
that will be. I can see some of the effects of using "wireline" that
HAVE already happened, however, and I can extrapolate from that.

This is a subject that should be examined in a lot more depth than I've seen so far. A while back, I made some pointed inquiries here, and for the most part, I got a lot of "attitude" in return. You've been the exception, for the most part, but you're still a strong advocate of a position that's anathema to a lot of hams, and seems, on its face, to be against the spirit of ham radio and harmful to it.

I'm hardly a Landline Lid, and I agree that the bulk of BBS traffic is
mindless drivel, flames, and ForSale messages. There's plenty of room
for improvement, just to get the S/N ratio back to what it was 8 or
ten years ago.

Maybe if both sides "wised up" and started looking for compromises,
both sides could set up a win/win situation. You can scream "Landline
Lid" all you wish, but that's not going to slow the inevitable.
Sometimes it IS better to switch than to fight.

My vote -

Leave the arguement in. Don't take it to email.
I love reading Carl's opinions. He's like a
skin head or a bible fundamentalist preaching
on the street corner. Better than watching the
comedy channel. I can just picture the sweaty,
Jimmy Swaggart like, armpits as he composes
new messages. Perhaps, like the fallen Rev
Swaggart, we'll find Carl in the back room some
day, tapping out cw.

I'd like to hear just what it is that Carl wants
to do on the 'code restricted bands' that he
can't do now because of the big, bad impossible
code.

I'm pro code. I NEVER use code. I'm proud to say
I know code. A lot prouder than I am to say that
I knew the answers to some theory questions about
monostable flip flops. That one just doesn't seem
to attract the girls as much as Morse code.

>commercial applications to not cause meaningful interference? That was
>my understanding anyway.

Don't blame the FCC for this mess, David. The blame goes straight to the door of the ARRL. Well, the FCC is culpable, but not in the way you think. A little history of the issue may be in order. Over the last decade, a number of amateur organizations and individuals have requested STAs to escape the current draconian SS rules. The FCC has granted most of them, but they are a paperwork nightmare. Finally, the FCC asked just what SS rules the amateur community wanted so that there'd be an end to the STAs. Of course the ARRL, representing itself as the spokesman of amateur radio, filed a petition, and the result is RM8737.

Since 1981, the FCC has de facto abdicated its responsibility for promulgating amateur rules which support amateur radio's charter. That's the last time the FCC put forward a plan of its own to significantly reform amateur regulations. That plan was met with such hostility from the ARRL that the political capital it would have cost to ram it through was more than the FCC was willing to expend. So since then the FCC has taken the position that whatever the ARRL wants, as long as it doesn't cause the FCC extra work or aggravation, it can have.

The ARRL could have asked to have SS be put on an equal footing with OOK, IE available on any amateur frequency and at any amateur power, and the FCC would have rubber stamped it. But that isn't what the ARRL did, of course. As was the case with automatic HF forwarding, the ARRL sought to craft rules which would be as restrictive and limiting as possible. And they have succeeded admirably in accomplishing the goal of making sure SS won't become a mainstream amateur technique.

Most of the motivation for the ARRL's consistent opposition to meaningful deregulation is in my opinion pure NIMBY. It has gone way out of its way to ensure that the vested interests of traditional CW, SSB, and FM repeater operators are put ahead of the service's charter goals of technical advancement and education, even in cases where those vested interests aren't really threatened. That's why SS is to remain limited to upper UHF, and retains a secondary status to any other form of amateur operation. (No other operating mode is so restricted.)

However, in this proximate case, SS was shot in the foot by one of its leading proponents. Phil Karn, on the ARRL FASC, was the one who strongly pushed the idea of embedding a formal APC requirement in the SS regulations. He has since seen the light, but the die is cast.

The ARRL petition has moved on to the status of a rulemaking.

APC makes sense in a cellular CDMA environment, such as the one that Karn's employer Qualcom provides. It is a strictly controlled hub and spoke arrangement with none of the ad hoc cross connections found in amateur networks. But amateur networks will never be cellular because we are too thin on the ground to make that feasible except in a very few metropolitan areas. So embedding APC into amateur SS regulations is tantamount to signing its death warrant as a mainstream amateur technique. I think Karn realizes that now, but probably too late to stop APC from becoming embedded in regulation.

Personally, I think Lyle Johnson has the right idea about amateur regulations. He said that they should say, "These are the band edges, stay inside them, observe good engineering practice, and have a nice day." Anything further should be an internal matter among amateurs, and not a government concern.

Dear Brad,

I have been asked to become involved in GPS as the government here is thinking of remapping the country. A gentleman that I work with has some interest in providing the equipment. I had reached much the same answer that you have reached.

I don't know if I am going to be asked to solve the same question but just in case I am, I would appreciate your letting me know if you get any good leads on software or other good solutions to the problem. TIA

Best regards,

Art Borg

ART,Most replies I have received tell me that this system will not help at all because to really remove the wrrors you need data for each satelites that base station sees so the roving receiver can give more weight to the sats for which it had error data.

I would really like to see some numbers on this I think on a local level the average total error for two receivers should help remove at least a some of the error how much I don't know.

so what I am looking for is some softwere that you can input the base stations location and have it figure a error factor and transmit that info. through radio to another radio and modem to another computer that can compare that error factor with the data it is getting from the roving gps receiver and display the corrected possition.
as for equipment I have the radios and the gps's and a computer so I'll need two modems(TNC's) and a laptop and the softwere to complete the setup.

have a fine day.
brad

Sounds like the fighter pilot who rolled his aircraft upside-down
so the enemy couldn't see him...

I hate to be the bearer of bad news, but take a look at ko4ks.ampr.org
and tell me all thos call-signs aren't Ham radio. Go ahead, roll over now,
ignore it.

What most of the anti-Internet Hams are fixated on, is Hams using the
internet to tunnel, or forward Ham files. This is merely a quirk in the
space-time continuam. What will happen, is that all that crap will
disappear rather quickly. With the advent of cable modems that
perform telephone, video, and data at 4 Mbps why would anyone
do radio anymore? I mean mainstream, not those who live outside
of cities. Packet will be nothing more than a DX cluster, or keyboard
chat thing, like it was before netrom came out. 1200 baud is where
it is, and where it will remain.

Steve

>>faster and more assured too, given the uncertainty of delivery of today's
>>message forwarding systems.)

This, from the nonexistant "only true network", I suppose. And, of course,
we are to believe that Gary's non-existant "network" is faster.

Hee Hee!

>>Message forwarding is an application layer
>>issue, it is not a physical layer issue or a link layer issue. It isn't
even a
>>network layer or transport layer issue. And it most emphatically is not
>>packet switched radio.

That's why it concerns you so much? (You talk of little else) Or I wonder
if it's because the network you say doesn't exist actually DOES (packet) --
While the "network" you keep trying to push DOES NOT.

Again, don't forget to ask just about any ham how large the concept of
switched packet networks figures in their thoughts about amateur packet
radio. - If you have trouble finding a ham among your peers, I can dig a
few up for you.

Remember: I said ask any Ham, not any dweeb.

>As usual, you insist on ignoring the forest while concentrating on the
>trees. No matter how you sugar-coat it, use of the Internet does NOT
>involve ham radio. Now, we can argue the definitions and usages of

>the words until the cows come home, but the facts are not changed.

Glen, you have to understand that the word games are about all Gary has in his little "arsenal".

That's his substitute for rational thinking and discussion.

Take away the "dumb act" -- "I don't know what you are talking about!", and there simply isn't much left.

His strategy, I suppose, is to waste everyone's time by playing the clown.

>Perhaps Internet links are the way to go; I don't pretend to have the
>ability to read the tea leaves and see what the ultimate result of
>that will be. I can see some of the effects of using "wireline" that

>This is a subject that should be examined in a lot more depth than
>I've seen so far. A while back, I made some pointed inquiries here,
>and for the most part, I got a lot of "attitude" in return.

You don't consider the "I'm too stupid to know what that word means" act to be "attitude"?

I do. It's a belligerant, ignorant attitude which wastes the time of everybody involved in the discussion while doing absolutely nothing to clarify the issues. -- Which I take as a sign that Gary does not WANT the issues clarified. - Otherwise, why the insistence upon his "stupidity" smokescreen? Hmmmm ?

> You've
>been the exception, for the most part,

See the above.

>but you're still a strong
>advocate of a position that's anathema to a lot of hams, and seems, on
>its face, to be against the spirit of ham radio and harmful to it.

Well Glen, if you think pretending to entertain doubts as to the destructiveness of "Amateur Telephone" in order to further discussion with LandLine Lids will lead you in a productive direction, go right to it.

I think it's a waste of time, which plays right into their hands. Try calling a spade a spade, and a Lid a Lid.

More than anything, Gary and his buddies want you to forget about being a ham, or at least lose your sense of pride and fellowship.

Maybe I'm wrong, but I don't see that happening.

Greetings all!
Your comments may be true in perhaps most cases, but certainly not of ALL no-coders. You might have better served the fraternity of ham radio operators, by not making your comments "all inclusive" of no-coders. I came onto the amateur radio scene as a codeless tech. It took me almost a year to upgrade, but while I was a codeless tech, I earned the respect and friendship of many VHF enthusiasts. One of my favorite activities was to put my gear in the truck, and venture out into areas where no ham had operated from before. I also went out of my way to help expeditions and hams in need, find equipment they needed. I did this without the need for CW. Please don't get me wrong, I now know the benefits and advantages of knowing and using the code, but my ego did not get bruised due to the fact that, in my first year, I didn't know it. Your post is divisive, and will certainly increase the gap between you and your codeless counterpart. While knowledge of morse code will help us all to become more proficient hams, It shouldn't be the cause of division in our ranks, even by the no-coders.

The only thing I'm finding REALLY wrong with XPWare is its internal maildrop. Even when off, it seems to affect what happens when people connect on the HF side.

And on outgoing connects, it tries to send its command line to the HF maildrop I've connected to, and a continuous loop of error messages ensues.

If Mr. Johnson fixes that, he'll have my 80 bucks. If not, I probably can't continue using the program.

And I've never seen ANYTHING that handles multiple connects better, so I'm really hoping this maildrop thing gets resolved.

Regards,

Hello everyone,
My name is Chip and have been in and out of ham radio for more years than I want to admit. I'm interested in pursuing the digital part of the hobby, and have a few questions;
1. What is the most common/preferred/best method of communication by computer keyboard? RTTY, Pactor, Amtor, etc.
2. What type of equipment do I need? I currently have a modest setup, a 486 computer with a Kenwood TS820S transceiver.

Any advice, commentary would be appreciated.

Here's the deal, there is no amprnet in my area, I haven't even been able to locate the guy who used to do it. I have no idea how I will manage to find someone to allot me the necessary IP addresses for an amateur network. I have some names, though the person who gave them to me said it was iffy that they even covered that sort of stuff in our state.

The message was entered at w4ral, a real forwarding BBS system by your standards.

Try that Brian dude at ucsd who "owns" the amprnet. (Since he ponied up the
50 bucks or whatever.)
One of the other tcpip enthusiasts can give you more specific info on
contacting him, I'm sure. (I forgot his last name and callsign.)

If Brian can't fix you up with a block of IP addresses, he will know who
can!

(pssst! -- For best results, don't tell Brian I sent you....)

>The message was entered at w4ral, a real forwarding BBS system by your
>standards.

It still hasn't arrived, which makes me suspect either a problem at W4RAL,
or a "Lockout Lid" somwhere along the line. Normally, once a P type message
is in the system, there's not a heck of a lot which can stop it except
deliberate action by one of the forwarding station's SYSOP. (Lockout Lid)

Do you disparage the packet net and BBS net there is your own neighborhood,
the same way you do here? Have you made a local reputation for yourself as a
"LandLine Lid"?
What I'm wondering here is if you might have made one too many anti-packet
or anti-BBS comments to one too many hams there in your local area, thereby
making a "reputation" for yourself as a troublemaker.

Being an obvious troublemaker can sometimes lead to poor service from your
local BBS. This is by way of explanation, not agreement with the policy. For
my part, I always see Lockout Lids as trailing slime behind. The practice is

ignorant and destructive, in my book.

For the curious: I have had only one real "troublemaker", in my time as a SYSOP. The guy kept trying to tell me how to run my station, but rejected my suggestion that he run one of his own. (I'm the only BBS in this area - Another one would provide some backup.)
Since I ignored many of his suggestions, he made several attempts to "hack" his way into having SYSOP status so he could make changes on his own.
When that didn't work, he became abusive, and finally ended up threatening my family, and having his 75 meter "goon net" buddies send me threatening mail, phone calls, ect.
Then tragically, the guy was found dead at his job (Local Motel clerk) all shot full of 9mm rounds at close range. He had pulled a gun during a dispute over motel laundry with a customer, and the customer defended himself, sending "troublemaker" to his reward.
I never got to thank the guy. He ended up getting in trouble over the incident, though really he shouldn't have.

At any rate, what I'm leading up to is a confession of my one time as a "Lockout Lid". I denied "troublemaker" access for a month or so at one point. By the time he managed to get himself killed, though, he had access again.

Try sending your message again.

Hi Bernd

If you really want to write windows software then might I suggest
that you start with a 'simple to install' KISS mode TNC driver for
the Win95 IP stack. There are *so* many kludges out there that
a single 32bit protected mode VXD and toolkit that installs like
the MSDUN stuff does would advance packet radio by 3 years
in as many hours!!

(I do it myself but I don't have the SDK, DDK or C++ compilers
suitable for the task)

>1. What is the most common/preferred/best method of communication by computer
>keyboard? RTTY, Pactor, Amtor, etc.

For *HF*, PACTOR I is currently the most popular (except during contests when plain RTTY is most popular). AMTOR is fading fast, but is still in fairly wide use. None of these are best, however. The current amateur bests are Clover II and PACTOR II. Debate still rages over which of them is best. It depends on your metrics to a large extent, both excel in certain ways. But in any event, either one handily out-performs the lesser methods. But there isn't a very large installed base for either one yet, so you'll want to be able to at least do RTTY and PACTOR I too. For VHF+, it is all packet.

>2. What type of equipment do I need? I currently have a modest setup, a 486
>computer with a Kenwood TS820S transceiver.

There are two approaches you can take. You can buy a multimode box to use as an interface between the radio and computer, or you can use a mainly software approach. If you have a Soundblaster card, Brian Beezley's RiTTY is a very good way to go. It does RTTY and PACTOR I, and it does them very well via host software DSP. A 486 is just barely enough computer to run it. Cost of the software is about $100 (well worth it).

If you want to be able to do Clover II or PACTOR II, you need hardware DSP. HAL offers a plug in card for the PC called the P-38 which does Clover II, PACTOR I, AMTOR, and RTTY. Any PC with ISA slots will work with it, IE won't work with a laptop. It costs about $350. SCS offers an external DSP box called the PTC-II. It does PACTOR II, PACTOR I, AMTOR, and RTTY (and with optional daughter cards, packet). It costs about $1,000. All it needs is a computer with a serial port, so you can use it even with a laptop. (HAL makes a similar box for Clover II called the 4100, but it costs nearly $1,000 too. The P-38 is the most cost effective choice among these high end systems.)

Dropping way down in capability, there are the Kantronics KAM and the AEA (now Timewave) PK232. These are non-DSP units which, with recent firmware updates, can do PACTOR I, AMTOR, and RTTY. The KAM can also do a Kantronics proprietary protocol called GTOR. Since these don't use DSP (the KAM uses switched capacitor filters and the PK232 uses state variable opamp filters), they can't dig down into the noise like the DSP units can, but they can often do surprisingly well. They also do packet. HF packet is pretty worthless, but you can use them for VHF packet. The

KAM can do VHF and HF at the same time. The PK232 can only do one at a time. Cost for either is in the neighborhood of $300.

MFJ also has a unit called the 1278 which is similar to the PK232. And AEA made DSP boxes, but the firmware wasn't fully debugged before they went belly up. Timewave says they're working on it. If they get the firmware sorted, the DSP-232 may be a viable option.

Dropping way way down in capability, there are the Hamcomm and Baycom software and dongle approaches. You need pretty strong and interference free signals for these, but they can work for you at a very low cost. RTTY and packet only as far as I know.

If you're mainly a contester/Dxer, then you can homebrew a competitive RTTY TU pretty cheaply. Just use the Hoff design using 88 mH toroid filters and an opamp slicer. If you carefully optimize it, you'll hold your own against the KAMs and PK232s, and maybe ocasionally wipe their eyes for them. This is a near optimal design from 30 years ago. It won't beat Beezley's program, but it can be mighty impressive and can be built for under $50.

Your radio will be fine for any of these modes, just remember to throttle the power back from its SSB value because these modes are continous duty. Figure no more than 50 watts output.

Nope, its clear from the bushes I've prodded under what I want to do. I don't set out to intentionally disparage anything. I figure they can have their choice, but I don't want to be left with a inadequate dying choice, myself.

> What I'm wondering here is if you might have made one too many anti-packet

Nope, the BBS specifically noted that the message was already being forwarded to a Rocky Mount BBS. I figured it was "on its way". What codes do I use to have the BBS system confirm and send trace if such a thing exists? At least I can find where the bottle neck actually is.

Hi,

I've been looking for a very detailed map of the Costa Mesa and Santa Ana CA areas to use with WinAPRS, but so far, I've been unable to find any. Is it possible to use maps from other software (such as some of the street-mapping software now available on CD from many companies)? If so, which software has been used, and what is involved in converting it (if necessary) to work with WinAPRS?

>How utterly moronic.

Looking for solutions is far less moronic than getting locked into a
mindset that assumes your way is the only way, and that everyone who
questions that assumption is a "Lid."

>You just lost my respect, buddy, and that of many of your other fellow hams
>you just wrote off.

I don't want or need your respect, and I'll thank you to let all those
"other fellow hams" speak for themselves, at least until I see
evidence that they've elected you to speak for them.

In the meantime, perhaps you can explain how suggesting compromise
solutions is "writing off" anybody but hardheads like yourself who
have only their own interests at heart.

We have recently upgraded our local LAN to 56K and now find ourselves
with several surplus 9600 baud links! We are looking to sell each link
as a matched set (because we know it works!).

Two (2) ICOM-IC38A 220Mhz Rigs 25 Watts out
Two (2) MJF 1270C TNC/s with G3RUH 9600 baud modem installed.

$950. For both ICOM Rigs and TNCs!

Two (2) Tekk KS-900 2 watt UHF Data Radios (crystaled for 441.050)
Two (2) MFJ 1270 TNCs with G3RUH 9600 baud modems installed.
This was one or our best links before the 56K went into operation.
Don't be fooled by the 2 watts output, put this on a good beam
15-20 miles is no problem.

$550 For both Tekk Rigs and TNCs!

Please - Serious inqueries only!
e-mail to karl@hamgate1.sunyerie.edu or rbrodow@pce.net for
more information.

Karl Weir - N2NJH

Nonsense. If you're using an amateur radio network to access the
wired internet, you certainly are involving ham radio. How can you

not be? I suppose the radio usage could be pirate activity, but I can
assure you that only licensed amateurs use our GRAPES network.
And they do that using amateur radios on amateur frequencies
operating under Part 97.

Most of the activity on the GRAPES RF network is strictly among stations
in the parts of four states in which it exists. But there is also realtime activity
to other much more distant destinations which do involve internetworking
via a wireline provider for a portion of the path. The "last mile" (and usually
much more than the last mile since we only have one internet gateway in the
network) always involves amateur radio. There is no possibility of using the
GRAPES network without using amateur radio.

No matter how you wiggle, squirm, or twist, that's the truth of the matter.
We have one of the largest and fastest packet switched radio networks
in all of amateur radio, and it is enhanced by also having realtime access
to the entirety of the global wired internet via a gateway. Railing against
that is like railing against a phone patch on a repeater, IE it makes you
look like an idiot.

Note well that GRAPES only provides realtime packet switched network
services. GRAPES does not operate BBS systems, nor any other store
and forward messaging system. That has nothing to do with packet radio
or packet switched networking. Some of the users of the GRAPES network
operate BBSs as user applications, but that is none of GRAPES' concern.
GRAPES doesn't involve itself in user applications or their politics. That's
a layer seven issue. GRAPES involvement stops at layer four. GRAPES
member LANs can address that sort of issue if they like, but GRAPES
does not.

>not be?

Yeah, and if you set off to bicycle across the USA, then pedal down to
the Greyhound station and ride the bus across the country, you are
certainly "involving" the bike, but you're not doing much to promote
the hobby of bicycling. Once again, you're quibbling over
definitions, and avoiding the rather obvious fact that the Internet is
not ham radio.

>Most of the activity on the GRAPES RF network is strictly among stations

That's not the point.

>No matter how you wiggle, squirm, or twist, that's the truth of the matter.
>We have one of the largest and fastest packet switched radio networks
>in all of amateur radio, and it is enhanced by also having realtime access

>that is like railing against a phone patch on a repeater, IE it makes you
>look like an idiot.

I'm not railing against it. I can see the principle involved, and
whether or not I agree with is not the question here. I submit that
GRAPES is a rather unique and isolated instance, at least in the USA.
Increasingly, we have BBSs, TCP/IP nets, and even repeaters being
linked together by the Internet, often to the detriment of existing
radio connections, and almost always with the result that interest in
building or improving those radio networks is reduced or eliminated.

No doubt you will tell me how GRAPES has not had this effect, but I still say that from what I've observed, GRAPES is an exception. How many other long-term, wide area networks are there (in the USA) that are similar to GRAPES?

>Note well that GRAPES only provides realtime packet switched network
>services. GRAPES does not operate BBS systems, nor any other store

>member LANs can address that sort of issue if they like, but GRAPES
>does not.

This is just more arcana that's of little interest to the end user, and has nothing whatsoever to do with the issue of radio vs. wireline linking.

It may be illegal in the US of A but not everywhere......here in the Great White North it is legal to listen to any wireless signal be it celluar phone, baby monitors, cordless phones, gov't stuff or anything else as long as you don't repeat it or use it to your own benefit... ie...stock market etc.....Whats the difference between listening to your neighbour on a cell phone or listening to the police making a report about your neighbour (which, I believe, is legal in the U.S.A.). If you are using a wireless transmitter, you should have the common sence not to devulge any personal information over any wireless transmition anyways....

Allocations of frequencies aren't private by anymeans and if you have the receivers to receive or the software to decode then you should have the right to listen.....it may not be moral but it shouldn't be prohibited.

There are mods on the internet for just about any amateur radio to receive cellular as well as non-distructive mods (non-permenent) for most cellular phones to become cellular scanners. And I'm sure that someone is working on or has already developed a way to decode digital encryption for celluar phones.....it's only natural...something we can''t have, we want!!

My 2 cents worth anyways....

All that I want to add is. Radio freq. Move Thru FREE space. They also enter my home and my body. I feel that if these wave enter my home or body I can do with them as I please. This means I can take these waves that enter my home and demod them the way I want. I have a right to know what is in my home, in my body, and in FREE space.

Hello everybody,
I found another packet radio programm for Win at:

http://www.forthnet.gr/sv2agw/

I tested it. It works also on a baycom modem.
I had a few bugs, but a new version is perhaps available.

Well, I don't know your amateur population statistics, but I do know
that there are about 4,000 amateurs in the 30,000 square miles
serviced by the GRAPES network. Of that 4,000, about 500 are
active in any fashion with packet, and the network itself was built
by about 20 people who wanted it bad enough to do it. We didn't
try to arrive at a consensus with that 4,000 or that 500, we just
went ahead and built the network. Those who found what we had
done interesting, exciting, and useful signed on board later.

>>Could it be because we've avoided the hangups about BBSs and message
>
>No, it's because you've avoided or bypassed political squabbling.

That's what I said. :-)

Once you subtract out the petty BBS wars, there is really very little that is
contentious among packet radio operators. Give them a fast and reliable

packet switched network, and they don't find much to complain about except
that it isn't expanding as fast or as far as they'd like it to do.

>>forwarding *applications* while concentrating on delivering fast and useful

>Sure. It's called the Internet.

Too bad, ours uses packet switched radio technology to cover 30,000 square
miles, and has a gateway to the wired internet to boot.

>>We've been successful because we've laid an infrastructure that supports

>or competing with it.

There's no doubt we've been blessed with a dedicated core group
of networkers who have unstintingly contributed their time, expertise,
and funds to the network. But the technology has been key too. It has
kept us competitive so that we continue to attract users rather than
see them dwindle away. 56 kb is just now coming to the dial up masses,
we've had it for over a decade. (And soon we'll leapfrog the wireline
technology again by a large enough margin to maintain that edge for
another decade.)

>Bottom line, however, is that you did it "your way." Dissenters can
>play, or leave, just like anywhere else.

You bet. We know we aren't a monopoly, and we don't act like one.
If someone wants to do something different, they are more than welcome
to go right ahead and do it. If it works better than what we're doing, we
might ask to be included. And we are always willing to let others use
what we have built. But we won't let the tail wag the dog. We will not
let others dictate how we run our network.

>Somebody in your group has some rare and outstanding "people skills,"
>I'm guessing. In any volunteer organization, this is much more
>important than technological skills. Among hams, diplomacy is a rare
>thing indeed.

I don't know if I'd call him a dipolmat, though everyone who met him liked
him. He was the most dedicated and hardest working fellow I ever met.
He gave unstintingly of his time and talent, more than any five other people.
And he is the real father of our network. Sadly, he is gone now, but he won't
be forgotten by those of us who knew him. WB4GQX, more than anyone,
made GRAPES what it is.

Of course, without WA4DSY we wouldn't have the technology we have.
And without KD4NC we'd likely not have a viable network architecture.
And there are a number of others who have worked tirelessly to make
it all come together and who have kept it running. We have been blessed
with a good group of people, but I don't think that's too unusual. You can
find good people in any group of amateurs.

I see I've used "we" a bit more freely than I should have. I've played a part
in GRAPES over the years. I served as president of one of the member
LANs, as a GRAPES board member, and as a member of the network
committee, but it really should be "they" and not "we" who get the real
credit. Anyone motivated could have done my part, but some of the
people we had (and have) are really special in their dedication to seeing
that the bits flow.

They're the ones who get out of bed in the middle of the night and go to the
mountain top in an ice storm to get a switch back on line. They're the ones
who drive hundreds of miles in a weekend to help some local learn how to
maintain a switch. They're the ones who climb the towers and water tanks
to fix antennas. Etc. Though I will brag a bit and say that I did once climb a
tower and do some welding up there to repair it when no one else dared go
up. And I have, perhaps uniquely, mounted a home refrigerator 670 feet up
a tower to act as a conditioned cabinet for a 56 kb switch. Kept the cokes
cold too. But while I've spent hundreds of hours at sites over the years,
others have spent thousands of hours building and maintaining sites.

Harper College in Palatine, IL will hold their one-day NO CODE Amateur Radio Review Course and Exam on Sat. May 23, 1998. If you or someone you know want an easy way to a License, this is it! Start at 08:30 review Radio, one hour lunch break, review Law and Operating Practices, then take the Exam at 16:30. Every subject on the exam is covered, hence if you have any physics or math background or have a radio background this is the "HAM CRAM " course for you.

Total course including pre-course notes and exam $20.00.

Call 847-925-6996 for details.

Please copy and post at work and on local northern Illinois BBSs and nets.

Thank you;

Here's some info that a friend gave me and which has worked successfully.
Good luck & 73, Sandy W7BX/7J1ABV

Message from Dave Hyte 7J1AIW/WZ1S RE: Cabling for the KAM & FT-1000D

1. FSK Operation (Closure to Ground to Shift)

TNC Line RTTY Jack Pin
FSK 1
RX Audio 2
PTT 3
Shield (GNC) 4

2. AFSK Operation (Mark/Space Tones from TNC)

TNC Line PACKET Jack Pin
TX Audio (AFSK) 1
Shield (GND) 2
PTT 3
RX Audio 4

Ahhhhhhhh, u r into the MAJOR heartburn zone now, making the RTTY/PKT
cables for HF ops! Ok, coming across the same prob you have, i.e.,
connecting BOTH 1000d cables to the SAME KAM cable, I finally said,
"uh uh", and just made a whole new set of cables from scratch. Here's
how.... (sidenote: pin2 on RTTY conn IS the same as the DATA IN for
the PKT conn, it carries the actual data to the rig; for the "padding",
I just left the KAM jumper (K5) in the LO posit and it werks fine.
the 1000d audio will be adjustable via ur RF gain and that handles
it nicely if the PKT is too strong. it has no affect on
RTTY/AMTOR/PACTOR ops ne; also I did run seperate PTTs, dunno
if I needed too or not, 1000d schematic is a killer).
Ok, I went to Tokyu Hands (you shud choose somewhere closer)
and got 1 meter of 6 conductor (really 7 with the braid) and did this -

1000 RTTY/AMTOR/PACTOR (4 pin) 1000 PACKET (5 pin)
pin 1 > pin 5 of KAM pin 1 > pin 1 of KAM
pin 2 > pin 6 of KAM pin 2 > pin 2 of KAM
pin 3 > pin 3 of KAM pin 3 > pin 3 of KAM

pin 4 > pin 2 of KAM pin 4 > pin 6 of KAM
pin 5 > not connected
KAM HF (8 pin)
pin 1 > pin 1 of PKT
pin 2 > pin 2 of PKT/pin 4 of RTTY
pin 3 > pin 3 of PKT/pin 3 of RTTY
pin 4 > CW ONLY - not connected (this will cw key the 1000 if ya take it to the center of 1/4" jack at the rear)
pin 5 > pin 1 of RTTY
pin 6 > pin 4 of PKT/pin 2 of RTTY
pin 7 > not connected
pin 8 > not connected (FM PKT ONLY - squelch line)

This setup will allow FULL RTTY/PKT ops on HF AND also allow you to receive CW (via the rtty rcv pin 2). If ya wanna SEND CW, then ya gotta hook up pin 4 of the KAM to the rear cw key jack (I didn't bother - YET).
Hope this helps, it was a BEAR to figure out reading half a dozen different books, making drawings, looking at the schematic, different labels/names for the same stuff, etc. HAVE FUN!!

>not ham radio.

I have never claimed that the internet is ham radio, but I do claim that
using ham radios is ham radio, and we do. Our users and our network
use amateur radios. And I would strongly suggest that it does promote
packet switched amateur radio. Our intranets probably have the largest
number of fully connected radio amateurs in the nation (over 500 users
with realtime connectivity spread over 30,000 square miles of parts
of 4 states). And the main reason for that is that we give them the packet
switched network performance that they want.

The internet gateway allows our users to expand outside our own network
and access the global wired internet, or IP tunnel to another RF intranet on
another continent. Like a phone patch on a repeater, it extends our users'
capabilities beyond what could otherwise be done with *just* radio. But
note well that radio, ham radio, is always part and parcel of every connection,
and that every packet goes over at least one amateur radio RF link.

If others want to provide RF links beyond our network, we're willing to
intertie our system with theirs. But we aren't about to do that at the
expense of bottlenecking the performance of our network or reducing
the capabilities our users expect from it. Then we'd also find ourselves
in a state of decline.

>>Most of the activity on the GRAPES RF network is strictly among stations
>>in the parts of four states in which it exists. But there is also realtime activity
>>to other much more distant destinations which do involve internetworking
>>via a wireline provider for a portion of the path. The "last mile" (and usually
>>much more than the last mile since we only have one internet gateway in the
>>network) always involves amateur radio. There is no possibility of using the
>>GRAPES network without using amateur radio.
>
>That's not the point.

Of course it is the point. It is amateur radio precisely because every packet
has to pass across an amateur radio link. That they may also in some cases
traverse other sorts of links in the process is irrelevant to the point or to any
of the users of the network. That's totally transparent to them.

>>No matter how you wiggle, squirm, or twist, that's the truth of the matter.
>>We have one of the largest and fastest packet switched radio networks

>
>I'm not railing against it. I can see the principle involved, and
>whether or not I agree with is not the question here. I submit that
>GRAPES is a rather unique and isolated instance, at least in the USA.

And as I've said, you should ponder why that is. We've got a success
story here while much of the rest of the nation's packet operations are
in disarray. I'm suggesting that lessons can be learned from that.

>Increasingly, we have BBSs, TCP/IP nets, and even repeaters being
>linked together by the Internet, often to the detriment of existing

>No doubt you will tell me how GRAPES has not had this effect, but I
>still say that from what I've observed, GRAPES is an exception. How
>many other long-term, wide area networks are there (in the USA) that
>are similar to GRAPES?

I'm not aware of another which is as fast and as large as ours. And as
I've indicated, lessons could be learned from our success. Our traffic
flow has increased every year we've been in operation. What other packet
switched amateur radio network in the US is in that position? From what I
can gather, none. Other packet switched amateur radio networks appear to
be seeing declining interest and activity. And that doesn't surprise me a bit
considering the poor performance and very limited span of packet switched
connectivity most of them appear to offer.

>>Note well that GRAPES only provides realtime packet switched network
>>services. GRAPES does not operate BBS systems, nor any other store
>>and forward messaging system. That has nothing to do with packet radio
>>or packet switched networking. Some of the users of the GRAPES network

>>does not.
>
>This is just more arcana that's of little interest to the end user,
>and has nothing whatsoever to do with the issue of radio vs. wireline
>linking.

This "arcana" as you call it is what packet radio is about. And it is this concentration on the fundamentals of packet switched networking which has led to the success of the GRAPES network. It would appear that some people have forgotten what packet radio is about. It would appear that all they can see is some BBSs which happen to use radio links but don't themselves support packet switching or packet networking. GRAPES didn't fall into that trap. We've remained focused on packet switched networking. Our users can deal with the application layer. That's not our business.

Those BBSs are just applications transplanted from a dial up phone line environment to one using radios (which often aren't even packet radios, IE they're some kind of TOR radio) as substitutes for the telephone company. They aren't packet radio, and they certainly aren't packet switched networking. And they also seem to hold a limited and declining interest for most of those amateurs who are interested in packet radio and packet switched networks.

But what we offer is a pure packet switched system of RF intranets and RF and wired internets which have the speed and capacity to support modern applications our users want to run. So we see growth and growing activity in our part of the packet world. If you want to see growth in your part of the packet world, get off your tail and start building fast high capacity intranets and linking them to others. That's what packet radio is about. Leave the provision of applications to the users. Don't constrain them, enable them, and they will come. It worked for us, it can work for you if you don't become embroiled in turf wars and instead concentrate on the job of switching and moving packets to the best of your ablility.

From the very beginning, our leadership kept reminding those of us building the system to think like a common carrier. They reminded us to keep our eye on the central purpose of switching and moving packets and not to get sidetracked into applications. Applications are the province of our "customers".

That advice has served us well. Instead of dictating to our "customers" what they can and cannot do, we've concentrated on providing a resource to allow them to do whatever they want to do (within the limits of Part 97), and making sure that resource stays competitive with any other resource that they might choose to use instead. We aren't a monopoly, and we don't try to act like one. We are well aware that our "customers" can choose another "carrier" if we don't measure up. But I can say with some pride that we have measured up, and we've achieved an expanding "customer" base over the past decade. Can you say the same?

>transmit the difference between that and the the normal GPS information
>received at the same site??

That's what they're trying to do, John, but it isn't good enough. The sources of error are SA dither, differences in the timebases of the various satellites, path geometry to the various satellites, varying propagation path delays, local multipath effects, delays in the receivers, and differences between different receiver implementations.

The biggest problem with their scheme is that it reports the benchmark position much less frequently than those error sources change. Commercial receivers only output their positions once a second, and we don't know *when* during that second the receiver grabbed TOA information from *which* satellite. So unless we can be sure that the two receivers did this simultaneously, we won't cancel out SA or the other error terms.

There are geodetic GPS receivers. The benchmark and rover are synchronized so that they look at the satellites at the same times and in the same order and share this information as timestamped samples so that SA can be cancelled. They also look at carrier phase from the satellites to compensate for the various timebase and propagation factors. Their *internal* clocks are also atomic standards so that they remain synchronized. These receivers cost thousands of dollars, but they can give centimeter position precision relative to each other.

Note that the timestamped deltas can either be shared over a terrestrial radio link, or stored for later retrieval, reduction, and reconciliation by a mapping program. The latter approach is often the preferred method for cartography. These systems are available on the commercial market. They are the correct solution to this problem.

You need a carrier recovery circuit in the demodulator. Usually, this will
be a Costas loop. It is built into some demodulator chipsets.

Check your local newsstand this month for an electronics mag
(can't remember which one - Pop Electronics?) that shows how
to build a POCSAG encoder. You hook up their simple circuit to
your computer and your transciever (must be capable of the
required baud rate) and can receive the POCSAG on a modified
pager. They also cite two companies who are willing to sell
pagers without paging contracts and will recrystal the pager
to the frequency of your choice. The article lists some radio
models that are capable of sending POCSAG, and while I didn't
recognize the model numbers, at least one was an Icom, so I
suspect it to be a ham-band transciever.

73 de Bob, KI8AB

(P.S. - there was a POCSAG decoder in the same mag in March '97,
apparently)

In article <69j18u$1hh$1@obsidian.us.dell.com>, "John Scott"
<john_scott@dell.com> writes:

>
Pardon me for being dumb, but if you know your exact position, can't
>you
transmit the difference between that and the the normal GPS
>information
received at the same site??

Of course, John. This is done automatically when special precision is needed, i.e. within a few meters, and is called DGPS, Differential Global Positioning System. DGPS was originally implemented by several different companies in answer to the purposely built-in inaccuracy of the GPS information when copied by civilian GPS receivers. Basically, the DGPS user's receiver receives two types of signals... the sigs from the satellites and a signal from an earth station that constantly compares the actual known position of the earth station with the transmitted GPS info and transmits the difference information. It's a pretty obvious work-around.

When GPS was still on the drawing board and the potential accuracy was seen to be pretty good, the military figured the Soviets (remember them?) would use it for missile guidance. Duh. even the dithered signal is accurate enough to get a missile in the ballpark, close enough for optical guidance mothods to take over. Anyway, that's why they did it, and that's why GPS only has dependable repeatable accuracy to within 50 meters or so, that's why they invented DGPS and that's why your question.

A reasonably clever ham could probably come up with his own DGPS protocols and implementation... maybe a packet sort of thing, whereby a mobile station could automatically request a correction signal when a button on the GPS gizmo is pushed, and a fixed station transmit the correction, which is instantly used to correct the indicated position. A PC based system would probably be the way to go, with an unmodified GPS plugged into one port and a dedicated transciever/modem for the correction signal RX and RQ in another one. For compatibility with notebooks, one device would have to use the parallel port.. Or, instead of transmitting only on request, a beacon could be used, transmitting the info in a burst every so often. Repeating the info for time diversity might be desireable. Of course, there would have to be a need for such a system before doing all that work, and I just don't see that many applications for it. However, maybe some of the APRS guys are already looking into something like this that fits in with what they're doing.

If you read these, be sure to then check out

http://www.tapr.org/tapr/html/presidents_corner.html

and also

http://www.tapr.org/tapr/html/relprimr.html

for the other side of the story.

>At this point your first step should be to identify and avoid supporting the
>negativity peddlers. Avoid TAPR and amateur tcp/ip altogether, and you will
>have eliminated over 70% of the total negativity which is presently going
>around. Maybe more.

Check out the TAPR web page and request information. I think you will find TAPR
is doing numerous interesting things. Of course, some tend to find something
TAPR is doing as bad in some form or another. Like any organization, you can't
make everyone happy, you just have to keep working towards doing fun and
educational things. Everyone is entitiled to their thoughts, but 2500+ and
growing membership must not be totally wrong. I am sure in ten years we will
know who was right. But then again -- who cares ? It is only amateur radio.
If you are not having fun or learning something, then you probably will find
something else to be doing with that time.

>Future of Packet? Well, the LandLine Lids have not managed to destroy
>packet radio in the US, but their negativity has managed to set back our
>progress by almost a decade now. To see the future of packet radio, take a
>good look at what is happening in Europe with the excellent FlexNet network
>right now. They are roughly ten years in advance of the US packet net.

This is were Charles and myself actually have always agreed. Packet Radio is no
where near being dead. Just read my articles and how I feel about it.
However, no one group, person, or organization is responsible for the current
state of packet radio. Amateurs did it without much help from anyone else.

Flexnet is an excellent solution, although I don't think it will take over the
world, since it has been around for over seven years now. If you want to read
more about Flexnet go to their site
http://dl0td.afthd.tu-darmstadt.de/~flexnet/ (note that they just changed the

site location for anyone who keeps up with this stuff) and then go to http://www.tapr.org/tapr/html/cncsearch.html and enter 'Flexnet' in the search field to see the various articles published in the Digital Communications Conference since 1991.

I feel that we are past the day when everyone wants to try to implement one common solution. The solution has to be local/regional in nature with the problem then being how do we connect these dispersed areas of operational interests. A lot of what Charles calls the "Malaise" in amateur packet radio is in amateur radio overall, not just digital communications. People just move to things that are new and interesting, which is what has happened over the last several years. We shouldn't be surprised that people have moved into new aspects of the hobby. The problem is that some of these people who have left maintined the networks and systems that everyone else used. With them gone, networks tended to fall apart.

The only thing that Charles and myself disagree on is how one operates, which I feel is no one business but their own. This is amateur radio and not critical surgery. If amateur radio ends tomorrow, will anyone notice ? A few of us, but not many more, so we have to have fun while we are alive and can accomplish things.

Anyway, check out the TAPR web page and see what we are doing with Spread Spectrum communications, DSP, some cool new HF modems running at neat speeds in bad band conditions, and probably some other stuff you might find interesting.

Cheers - Greg, WD5IVD

I guess folks havn't been keeping up with the various things that the TAPR HF SIG has been doing. There are some neat things happening. One of the items is listed below. The message below is an excerpt from last August of a new modem that has been under test for several months now and a lot of people are beginning to use. This is just one of a few modems that groups here and in Europe have been playing with.

Hopefully we will have the new EVM56002 interface kit available in the next few months will allow more people to get into playing with the modems the core development group are writing.

>Rob
>
>

Sorry that I have not posted more details - just not had much time to work on and refine a specification as yet. Hopefully more at the DCC.

A short(?) description for those that cannot wait :-)

As things stand at the moment, it is FDM (not OFDM);four RC-shaped DQPSK waveforms in parallel each at a 75 baud symbol rate - 600 Hz at -60 dB. Modulation is DQPSK that varies from BPSK to 16-DQPSK, selectable to match conditions. The full bandwidth is always used, even at low data rates, however, both time and frequency diversity is then employed. The idea is to use a common DQPSK demodulator that does'nt know the difference - it just demodulates the input waveform as if it were m-DQPSK. That is the job for the packet dissasembler that knows how to unpack the data from information provided in a data header. For that purpose, each packet contains a header that provides a) frequency tracking information, b) bit phasing/clock information (extracted from the sync vector), and c) packet formatting/status information (an ECC protected field). Actual data contents are convolutionally coded using a variable rate code on the inner level, with an outer level block code.

Three modes of operation is planned:

Mode A: Unconnected broadcast mode with full ECC.
Mode B: Hybrid ARQ.
Mode C: Networked (CSMA) with encapsulated TCP/IP.
Mode D: Read-along mode. It is possible for a third party to decode and read traffic, pretty much as we can do with packet at the moment.

All specifications will be published for the benefit of those that wish to implement the protocol. It will be an "open architecture" although I hope to encourage commercialization - consulting and user-support services can be arranged. One essential item that would be made available is a "golden" CD-ROM - this will contain the printed standard, also test and diagnostic signals that will help one to verify whether your implementation conforms to the standard or not.

Hope this helps in the interim,

Gary and Folks
I can see that time is a factor but . . .
Is the rate of change so fast that the error correction signals from your base would be off by say
10 meters?? If so great you have a 5:1 improvement there.

Does that work? Say the base TNC sends a question to the mobile unit saying My delta is .... please send your position. The mobile Computer would then figure out the present position, add the recieved delta and retransmit via the TNC...

I think that this would be fun to try..

That is exactly how DGPS works, why reinvent the wheel. If this isn't accurate enough for you then you can do post processing of the received data to get accuracies in the sub centimeter range, and if you need this in real time and your government is on good terms with the USA, they can get the encryption keys for the P-code datastream, which with post processing can have millimeter accuracies. Multiply the area by about ten, and divide the ham numbers by the same
amount, and you'll be looking at the situation in the Intermountain
area. Yeah, we have some nice mountains that you don't, but those
have problems, too. The site that has the solar repeater that I
helped establish many years ago has a coverage radius of 50-150 miles,
but it's only accessible, by 4x4, for a few months in summer. Not
only that, but it's nearly a full day's drive to get there and back,
let alone do any work. And that doesn't count the broken axles,
shredded tires, etc.

>by about 20 people who wanted it bad enough to do it. We didn't

>contentious among packet radio operators. Give them a fast and reliable
>packet switched network, and they don't find much to complain about except
>that it isn't expanding as fast or as far as they'd like it to do.

Once again, I beg to differ. Hams will fight about anything, as we
both know. Ham Packet is unique in that it requires widespread
cooperation among hams to work properly. The "BBS factor" has nothing
to do with it, as far as I can tell. Using the Internet lets you
bypass most of the politics, which is one major factor that's causing
hams to use it. Any _radio_ based network that requires standards and
coordination to work properly is going to run into the same problems
that the so-called BBS/NetRom system has experienced.

>>I beg to differ. If you've been successful, it's because you've had a

It's been said that "There's no limit to what you can accomplish, if
you don't care who gets the credit."

>to go right ahead and do it. If it works better than what we're doing, we
>might ask to be included. And we are always willing to let others use
>what we have built. But we won't let the tail wag the dog. We will not
>let others dictate how we run our network.

There are two vital items there. Letting others (no matter how you
might dislike them) use the system is essential, as is not letting
"popular vote" tell you how to do technical stuff.

>They're the ones who get out of bed in the middle of the night and go to the
>mountain top in an ice storm to get a switch back on line. They're the ones
>who drive hundreds of miles in a weekend to help some local learn how to
>maintain a switch. They're the ones who climb the towers and water tanks
>to fix antennas. Etc. Though I will brag a bit and say that I did once climb

[stories of dedication deleted]

Well, all that is essential, plus attracting other qualified people to
take over when the originators leave for one reason or another. Most
folks who have the proper skills in one area lack them in others, so
once again, it's a matter of rounding up the resources needed,
motivating them, and keeping interest alive. This usually takes an
extraordinary person as "leader." The needed synergy seldom comes
together in a critical mass, seems to me.

Until this stuff becomes widely and affordably available, as in the
case with TAPR-2 clones, it's never going to have much influence on
the overall health of packet radio, IMO. We've seen a lot of Pie In
The Sky from TAPR over the years, but hardly any of it has filtered
down to The Rest Of Us.

Hi....

Is anyone interested/knowledgeable etc about the 802.11 standard for
wireless LANS/networking?

I'm sure we could have fun with it on out microwave bands.
I'm also sure that the need for very high speed data modes is apparent.

VERY interested, but VERY ignorant on the subject as well!

Someone post some info?

I know all marine GPS units have an averaging function, and the averaging constant can be set from anywhere around a half minute to as much as a half hour. The averaging along with automatic DR updating should give remarkable accuracy if everything is set up right. If synchronized operation can be implemented, that is just too cool for words. But if not, setting the right averaging constant will be pretty good too, even if not ideal.

Oh.. an explanation of a marine term might be in order... DR stands for Dead Reckoning, which is a corruption for DED (deduced or deductive) reckoning, and involves assuming that an observed course and speed made good will hold true until another position update is required. This feature is found in even LORAN C sets and was even in a couple of very high-end automatic LORAN A sets, and works gangbusters with SATNAV and GPS. The only thing that will throw a robust implementation off is a major course or speed change over a small fraction of the averaging constant, and the system will quickly catch up when course and speed are relatively steady again.

Hope this was constructive. Sounds like you all have a really fascinating project going. best of luck

I have only seen equipment for 802.11 running spread spectrum. Which
means we have to wait for approval by "the government".

Is it possible to adapt the chipset to work on other frequencies? I know in the UK we can use any digital transmission method we want.

There is a whole chipset available from Harris
(http://www.semi.harris.com/families/wireless.htm) ,
but at least in Germany we may not use it on coordinated links, as the
bandwidth is too large. So these chips are useless for our packet radio
network. Remember: 2,4GHz is allocated to ham radio only on a secondary
bases.

I've used their LNA with success. Their PA is not worth called a "PA"
(only about 250mW out).

Hello all NRD535 (D) owners.

I discovered a bug in the ROM software of the set
The centre frequency on RTTY is 2095 instead of 2210.
That's not the bug. The bug is:
- put the set on
- enter 0.0 Hz (kHz, MHz)
- then push RTTY mode
- frequency meter reads output at 2095 Hz
- put set off
- put it on again
- Now it reads 2210
- after pushing RTTY again it's 2095.

So, if you use the RTTY often with a CF depended decoder, push RTTY
everytime you switch that thing on.

It comfused me a lot while adjusting some stuff .....

Your reactions are welcome! I have the ROM version H.....(i think the
latest.
Anyone has the email address of JRC, so I can mail them?

Kees

Hello all NRD535 (D) owners.

I discovered a bug in the ROM software of the set
The center frequency on RTTY is 2095 instead of 2210.
That's not the bug. The bug is:
- put the set on
- enter RTTY station frequency
- then push RTTY mode
- put set off
- put it on again
- Now listen carefully
- after pushing RTTY again it's pitch will change (went down); it
sound differently!!!

So, if you use the RTTY often with a CF depended decoder, push RTTY
everytime you switch that thing on.

It confused me a lot while adjusting some stuff .....

Your reactions are welcome! I have the ROM version H.....(i think the
latest.
Anyone has the email address of JRC, so I can mail them?

Injoy's documentation notes this may be a fucntion of the ISP requeting an outdated protocol and that it is meaningless. It shows up in all my connects with the IBM 1.67 (?) dialer with my IP, but then my system goes on and remains connected. BTW, I tried the level 1.69 dialer from IBM, the one with the yellow globe ICON and it won't connect with my IP, but the older one does!

Try something! Download INJOY's dialer demo. Yes I know it's paid for code, but in your case, $25 or $35 may be cheap if it gets you up and running. It can, apparently, suffer through more insults than the IBM dialer. Further, it really does have features that you may very well come to like! Although you may not see any difference in throughput, you just might, because of its ability to optimize the PPP interface with your IP. If just a reasonable bit of throughput upgrade happened, even at $1 an hour for your time would come back to you on a VERY short time sitting in front of your box. Further, you don't know it yet, but IP connections seem somewhat fragile! INJOY's redial feature is worth the price.

Alternatively, look up the SUMMERFIELD page. John has a batch file deal for you there that can, ass he notes, connect you in style.. Investigate!

They have told me that they have some 800 units being reworked. Apparently there is somesort of software issue that is giving them quite a bit of problems. My problem with them is that they have not sent me any RMA (return material authorization) number so I can return mine for simple repairs. I have a no audio on TX problem which renders the damn thing usless. I have sent faxes, I have sent emails, I have phoned them, all to no avail. So your experiences are not un-typical.

Hello,

I had a lightning strike to my Kantronics Kam Plus. The unit was
still under warranty, so I did not have to pay for repair.

Here is the Kantronics "Customer Repair/Return" invoice information
that may be of help.

Qty Desig Description Price

--- ----- ---------- -----

2 Q1, Q2 2N7000 1.00
1 U26 LMC 6034 1.60
1 U27 LMC 6032 1.30

My advice is: Do not take these prices literally. I suspect they
would charge much more, especially for labor, if you are having a unit
repaired "out of warranty".

I found Q1 and Q2 on Sheet 2 of the schematic at locations 3-A and
2-C.

I found U26 and U27 on Sheet 1 of the schematic at locations 2-D and
3-C

Good Luck OM.

Hmmm... I had version F and didn't notice that problem using an M-6000 decoder. Though there is a Web site in Japan, I think you'd have better results handling the query through JRC/New York. There is no e-mail address. See your manual for the postal address.

JAVASCRIPT BEAM HEADING CALCULATOR
http://www.mailbag.com/users/hanelson/beamhead.htm

Hi Gang!

I've just posted a project I've been working on for the last few days in an effort to learn something about JavaScript-ing. I'd appreciate all critical appraisals, suggestions, and additions. Please give it a try. The database currently holds about 900 DX entries.

It seems to work fine with Netscape 4.04. I've not been able to test it with other browsers.

Please be sure "Java" AND "JavaScript" are ENABLEd in your browser

http://www.mailbag.com/users/hanelson/beamhead.htm

Thanks a bunch

National sales and marketing of CCTV and accessories to the electronic
parts distributor market.
Looking for local LA area salesment to contact by phone and some travel
all of the walk-in electronic dist.
to promote our line of miniature cameras and monitors. CCTV and alarm
distributors also included.

Complete benefit package included.
If your interested see web site for product types:
http://www.mars-cam.com
Fax interest to 310-836-5327
or email reply.

390. Where can I find front end Win 95 software and eprom software for MFJ TAPR clone?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-17 00:00:00 UTC
From: spambuster@greeneggs.com
Message-ID: <69p02j$it2@elf.wang.com>
Source record: 25951

Two questions:

I have an older MFJ 1270, bare bones, packet controller that I am returning to the air. Remembering the DOS interface on the controller, I am looking for a front end that will offer a decent 95-style interface for the unit.

Is there such a beast? Does it work well? Is it on the net?

Question II

Is it worth plugging in a new emprom to upgrade the unit's software? Is the software available on the net so I can burn my own eprom?

Thanks
N1AUP

The mag was Electronics Now. The decoder is a simple comparator built using a 751 op-amp. The encoder was a simply wigging a line on the serial port up and down. There was an interesting thread some time ago on these simple circuits.

>Ask just about any ham if he cares.

Any ham as ignorant as you probably doesn't care. But those who wish
to do packet radio as opposed to operating a BBS, which has been ported
over to use radios instead of the telephone, will care. Packet radio is
centrally concerned with the realtime switching of packets, BBS activity
is not. A BBS application can *use* packet virtual circuits to simulate
dial up telephone connections, but that's perpheral to its operation. It
is not, itself, a packet radio function, and its forwarding activity is not
packet radio networking.

>>>Conceptually,
>>>message forwarders could be snail mailing hard copy from BBS to BBS

>That's why it concerns you so much? (You talk of little else) Or I wonder
>if it's because the network you say doesn't exist actually DOES (packet) --

>While the "network" you keep trying to push DOES NOT.

In fact, we operate a fully packet switched network. You do not. We are doing packet radio. You aren't. You're merely using virtual circuit connections to simulate a dial up telephone line. We aren't limited to virtual circuits. We can, and usually do, operate in disconnected mode using datagrams (UI frames) switched and routed by the network. You can't. What we're doing is packet radio. What you're doing is not.

Then perhaps "the rest of you" need to get off your butts and do something with the technologies being made available to you. The technology to do packet 47 times faster than what you're doing has been available for 12 years now. You can't point the finger at anyone but yourselves as to why you haven't deployed and used it yet.

You want something better? Then by God, you build it. I for one am getting damn sick and tired of your whining. TAPR and GRAPES and others have made the technologies available. We have given you an example of how to use it to form networks. What the hell more do you want? We aren't going to come to your house and install it. You have to make *some* effort besides getting on your keyboard and whining.

Sure it takes time and effort. Get off your butt and expend the effort. We did. Sure it takes money. Spend the damn money. We did. If you're not willing to do either, shut the hell up. As a TAPR member and a GRAPES member I'm getting very tired of your sniping. If you can't be bothered to expend any effort on your own behalf, not to mention on behalf of the community, what the hell good are you? We've put the ball in *your* hands. Run with it, or get the hell off the field.

>are no longer digipeaters but are upper level protocol routers, this will of
>course require a increase in TNC complexity.

You have basically just described AX25 UI frames minus the optional digipeat
field. No need to reinvent the wheel here. It's been done. Chalk another one up
to the foresight of Phil Karn. Compression probably belongs at the application
layer. There is no reason to require information to be decompressed just to
get to the network layer header required for network layer routing.

>2) Design and build small, inexpensive routers for 1200 baud from 6809 chips
>or such, something very small, yet powerful enough to handle the job, and
>that has freely available devel tools.

The TNC2 is already capable of being a router at 1200 baud when fitted with
the right firmware. Again there is no need to reinvent the wheel here. And besides,
you need to be looking at supporting something much better than 1200 baud.
You could do that as Gracilis did with the PacketTen via use of a Motorola
communications processor to handle up to T1 rates. But the drawback to that
is you wind up locking yourself into a single source proprietary embedded hardware
architecture. There's nothing wrong with using the generic PC as your switch. It's
cheap, its available, and it is definitely multisourced. Router code is already
available, and being used in the field too. All you need in the way of hardware
is a HDLC interface, and the PI2 fills that niche.

>3) Later on, devise powerful routers capable of handling 16 or more radios at
>once, so that multiple HF links can be handled, and that regional outbound
>traffic can be concentrated into one machine, reducing the number of sites
>necessary to shoot across country, therefore lowering cost, and increasing

>feasibility.

It's called a Linux PC. We have it, no need to reinvent the wheel.

>4) Revise the BBS standard to take advantage of the new protocol, simplifying
>BBS design.

BBS's don't care. Give them a virtual circuit and they work. This is an application layer issue. Don't give it another thought. Powerful multiuser BBSs already exist for Linux. They don't care what's on the other side of the socket interface.

>5) Have all software be capable of easy setup for upper level IP routing

That's what nameservers are for. They exist.

>6) Develop software for TNC2s that will do the same as 2

Already exists and is in use.

>7) Increase ease of use in setting up a IP system to simple GUI point and
>click simplicity (thats what I will not tell you about now) and remove the
>hardware signal conformity requirement from a PC machine that is becoming
>more and more proprietary and harder to build for and write drivers, to a

>simple as possible.

Linux. Accept no substitutes. Setting up Redhat is virtually point and click. If you must supply something for Wintel boxes, use a shim under the existing protocol stack. An external box is the wrong way to go today. Bring the network inside the computer where it belongs.

It doesn't require an extraordinary person. It only requires an ordinary person who will expend extraordinary efforts. In other words, someone willing to get off their butt and actually do things. That sort of person will attract others. You can't lead from the back of the pack. You have to get out front.

I can't reproduce the problem on mine. I don't know the firmware version of this one however. It stays on 2210 Hz. There's no rtty module build in.

Some extra info :
The s/n is BR 58308. Age about 2 to 3 years.

It's always a pleasure to look at the inners of the NRD535 with it's beautiful modular construction. Notice the ultra-flat power transformer at the back ! I also peeked at the firmware eprom sticker:

27c256 eprom (IC3, cpu board) : 7dejd0182 E (the E is stamped with bleu ink, probably a version ID ?), cdc-493ad

Hope this helps.
Joop

ps is there anybody out there that has modified the 8085 code ? some aspects of the user interface could use improvement. And maybe the rx range could be extended to, say, 32 MHz or so..

The internet is the best model we have for demonstrating what can be
achieved with switched packet technology. It serves as a benchmark
against which we can measure our amateur efforts.

>Packet is part of amateur radio, as such it doesn't have to compete with
>the internet - because the internet isn't part of amateur radio! If you
>can't see that point, then I think you need to ask yourself what your
>hobby really is.

The internet is a competitor with amateur packet radio, or more precisely,
the local dial up ISP is a competitor with amateur packet radio. That most
of the participants here are carrying on this discussion through a local
dial up ISP instead of via a packet radio link shows that by and large
amateur packet radio is losing that competion. It need not be so. We
have the technology to beat dial up. And it is fun to try.

What is not fun is beating a dead horse with a buggy whip. But that's
what many who claim to be amateur packet radio proponents are doing.
The methodologies they are using are as far behind as the buggy whip,
and just about as relevant.

The problem with averaging is that you're implicitly assuming that SA,
and other error terms, average to zero over some time interval. That's
an unwise assumption. Try averaging your house's position over a
few days. You'll find that the daily averages jump around quite merrily
inside the 100m CEP. They don't tend to converge to a single point.
To get geodetic accuracy, you can't depend on averaging.

> How do I determine which ROM version I have?

One way is to look at the ROM(s) themselves for a suffix letter. You have to remove covers to do so. Another way is to use a modem program to "talk" to the -535 and send a command -- I forget what it is, but it is in the manual -- via the keyboard. The answer is the ROM version. I think you probably have the F version, Don, if I remember when you bought the receiver.

>What you're doing is not.

Semantics. For as long as I've been around, this part of the hobby
has been called "packet radio." Still is, as far as I know. I don't
know anyone but you who tries to make a distinction between what's
been done by hams everywhere for the last 10 or 15 years and some
other, more "pure" form of digital comms. It's not all BBBs, either.
You can use the various "NetRom" type nodes for all sorts of other
things besides BBSing. You can even run your precious TCP/IP on them,
if you wish.

The average ham (99+ percent, I'd venture) calls it "packet radio"
whether he's doing BBSs, chatting, node exploring, APRS, DX Cluster,
TCP/IP, or whatever.

To be perfectly honest with you, I don't quite understand what you're
driving at, myself. You use a lot of highsounding technical terms
which mean nothing to anybody who's not a byte-head. You keep
trashing BBSs for some unknown reason, when the fact is that UseNet
itself is very similar to ham and traditional dial-up BBBs. In fact,
a good dial-up BBS network is more reliable, and nearly as fast, as is
Usenet, even with the "old-fashioned" methods used to transfer the
data. Even now, I can download a meg of messages from a phone BBS far

faster than I could (using the same modem) from UseNet because of the way they are zipped into one big package and compressed at least 50% in size. There's less overhead, too, of course.

BBSs and UseNet have the added advantage of being able to be used offline. I don't have much need or use for "live" connections except for some late night IRC chats, and the occasional WWW surfing looking for some information or entertainment. And for off-line use, even the outmoded old 1200 baud packet BBS network is fairly adequate.

You (generic term for the 'Net usage advocates, not you in particular) seem to be trying to do things with the radio network that are just not practical at the present time. Instead of working with what you have and slowly improving that, you've taken the easy way out and gone to the Internet to fill in the gaps that you can't or won't do with radio. No matter how you sugarcoat it with rationalization or fancy buzzwords, that's the bottom line, period. Whether or not this is good or bad for ham radio is not for me to decide. You may well be the "wave of the future" for ham radio, or you may be wrecking the hobby, or something in between, I dunno. None of that changes the fact that you're using something other than RADIO to interconnect your computers.

In other words, an extraordinary person. How many people in ham radio
fit your description, do you think? Hell, how many people in Real
Life fit that description? Also, you left out one important skill,
diplomacy. All the initiative and drive in the world won't do much
good if you can't motivate others. This combination is very rare, in
my experience. I know I sure don't have all the factors required.

As the saying goes, If it was easy, anybody could do it. It's lots
easier to sit around and bitch than it is to get involved. I know,
I've done both.

Hi Bread,

a few years ago there were some interesting articles in the german
electronic magazine called 'elrad'. (4/94-7/94)
They described howto build a GPS-decoder with OEM-modules.

There was a module from Motorola witch was able to compute range and
pseudorange correction data itself when given a reference position.
In the article it is named: 'Core Receiver Module'.
It was a 6 channel receiver and on the market since 1991/92.
So I think it is not longer available. But perhaps someone here knows
anything about an update.

Im very interested in this project, so please post any information in
this newsgroup or mail it to me.

Yes, there are 2 ICs and they plug inton sockets. Eprom
replacement is a laborious operation, involving removal
of all the knobs and the entire front panel.

> If so, how do you get a new one?

To upgrade the NRD535D's firmware, I purchased 2 revision 'H' eproms
for about $26 US from Universal Radio (November 1996 price),
This was required so the radio could be controlled via the
NRD 6.1 software.

Well, IMHO that isn't our fault.

The software and hardware is available in all the instances. You just have to gather all the information which is available and then be a ham and do a little experimenting. If you expect everything to be handed to you, then that is what non-licensed systems are about and they typically cost a lot more.

Every project, except two, have been made available as a kit or fully detailed for others to build or create.

I have always felt that the TNC-2, while being a great success, had a down side as well. Amateurs expected to much without any effort.

Source record: 25881

The TAPR TAC-2 and GPS list somehow decided to zap its subscribers list several days ago. If you were on the TACGPS list, you'll need to subscribe to the list again.

This can be done on our web page (http://www.tapr.org/tapr/html/sigs.html) or send an e-mail to listserv@tapr.org and in the body of the message put 'subscribe tacgps'

Sorry for the bandwidth. We didn't have a better way to try to contact the large group of people following the list that was lost.

If you know someone that was following the latest development on the TAC-2 and various GPS research, please tell them about this glitch so they can get back on.

Cheers - Greg, WD5IVD

That is a very poor argument! I am contributing to this newsgroup via a
dial-up to my isp, so what? In this newsgroup I *talk about* amateur
radio, but I don't regard that as either being part of, competing with,
or being a substitute for my amateur radio activities. In another
newsgroup I talk about cycling, but that isn't a substitute for riding
my bike!

423. FlexNet Packet System Install - Windows 95

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-18 00:00:00 UTC
From: "Gary J. Ferdinand" <gferdinand@ipass.net>
Message-ID: <34C1FCE8.7DF6A722@ipass.net>
Source record: 25887

I have spent the last several days reading and understanding the excellent documentation on FlexNet. I find it very exciting and am anxious to get it working in my shack. I'm hoping that someone on this newsgroup has FlexNet running under Windows 95 and can help me do the same.

The symptom I have is that the FlexNet system appears to work correctly when under DOS, but not once I've executed the WIN command and started Windows 95. At that point no AFSK is produced, although just a few seconds earlier, in DOS mode, it worked just fine.

I am certain that I have correctly defined an alternative Windows 95 configuration, that I have booted that configuration, and that the sound card in that configuration has been removed (it has a red X over it in the device manager window). As a precaution I have also removed all serial and parallel ports (except the one used by the mouse). There are no devices having conflicting resources.

The system is a Windows 95a version (4.00.950a, original+service pack, not OSR2), with 20MB of memory, ample disk storage, and a Soundblaster-16 card. I am using SM module SMSBFDX with the parameters set correctly to reflect the address, IRQ and DMA of the card (defaults of 220, 5, 1).

I have tried initialization with all the FlexNet commands in AUTOEXEC.BAT. I have tried putting them in CONFIG.SYS with execution conditional on the configuration menu choice (per FlexNet documentation), and of course I have tried booting to DOS and hand-entering them. Always, FlexNet outputs tones while in DOS and then goes silent when switching to Windows 95. I have not yet attempted decoding input tones in either DOS or Windows 95.

On the switchover from DOS to Windows 95, I get two additional messages from FlexNet: The first is a message about version 4.0 starting and the second is a message about the VxD 0.2a loading. Windows 95 then appears to boot normally after those two messages. After the boot the FlexNet icon appears for a brief time and then minimizes to the icon tray.

I then test the FlexNet system by bringing up BCT in a DOS window and, with just the speakers connected to the SB16 output, try a packet connect. Under DOS, I get tones; under windows 95, silent.

The version of FlexNet that I downloaded via FTP is 3.3g. Files downloaded off the 3.3g FTP directory were: pcf.lzh, sm.lzh, flex95.lzh, bct.lzh and tfemu.lzh. I have not yet attempted use of tfemu, wishing to keep the configuration as simple as possible for

troubleshooting.

Thanks in advance for your help! 73,

Gary Ferdinand W2CS
Apex, North Carolina, USA

424. Re: Wanted CW/RTTY software for sound card

Ed,

I, too, have been looking for this. If you find one, please drop me a message.

I have been using a contest-logging program written by N6TR for a CW keyboard (sending only). It is superb for contesting, but inadequate for straight CW or RTTY inasmuch as it's send-only and does not display what you're typing into the buffer so it's hard to keep track of what you're hearing being transmittted versus what you're typing, usually several characters/words ahead.

73,

Gary W2CS

I use an HP48 handheld calculator to control the NRD535 and
sending it a "?" followed by a cr forces the receiver to respond
with a report of model and ROM revision number. Hope this answers
your request.

<matt.green@shef.ac.uk> writes

Not 802.11 but you may be interested in a couple of things I and others
have been upto with networking on 10ghz in recent years.

In 1995 G7LWT and myself (G4GCO) successfully connected (networked)
together two networked PC's at G7LWT's Home with 3 PC's networked at my
home. The Network used windows 3.1 [and later windows 95] and operated
just like any other network of PC's with resource sharing, Drive mapping
etc. etc. The system at each end used commercial network bridges
(borrowed) connected to old BT Kilostream boxes.

For the last 12 months I have been involved in the develpoment of a
system with Jerry (G8GHO) in which we have connected together a network
of PC's at Jerry's house with a network at my house. The network used is
Windows 95, and again operates like one seamless newtork across two
sites. The difference is the data is transmitted on the back of a 10
Ghz ATV signal. The data is transmitted in the Field blanking period
and therefore allows simultanouse Data, Video and intercarrier sound.

This time the hardware involved is home made, designed and built by
Jerry G8GHO. We are looking for other like minded amateurs to share in
the cost and devlopment of the system.

The 'Video Modem' P.C.B design is fairly complex, (double sided plated
thro) so anyone who is willing to share in the cost or who can have this
made cheaply please get in touch.

I'm looking for an inexpensive TNC to connect two LANs in my home so I can share a printer (and occaisionally files) without having to run cables between floors.

I am also interested in a completely "portable" TNC (like the small Paccom device) that I could carry with my laptop throughout the house or over to the neighbors.

Thanks!

Thanks for reading this message.
I am in the process of setting up an APRS network for Northeastern Missouri. One of the members of the group has a DSP 232 and a PK 232 that we would like to put to use. The ideas is to setup an HF to VHF gateway using one of the TNCs or both. WILL a PK 232 operate as a gateway?? Thanks.

Hi-

Sorry, it's not fixed. I have 1.2.0 and still have the problem. I've been communicating with Mr. Johnson about that.

The problem occurs even with the program maildrop turned off. And with only 18K in the PK-900, a couple of long winded messages autoforwarded from the BBS can fill that right up.

Regards,

William Saunders wrote:

Those are all just *applications* or higher level network protocols. They
can use packet switched radio, but that isn't required, nor is it a central
focus. All they want is some sort of transport, it doesn't have to be packet,

and it doesn't even have to be radio. BBSs operated for years by dial up
until some people decided to use wireless virtual circuits instead. Those
wireless links are sometimes packet switched, sometimes they aren't.
It's not a central focus of using a BBS application.

When the focus is packet switched networking, the applications don't
matter. They're just bits to move and packets to switch. If you're interested
in packet radio, your focus is layer one and layer two issues, not layer
seven applications. When you move to layer three and layer four network
and transport issues, layer seven is still just bits to move. Packet radio,
and packet switched networking aren't concerned with layer seven issues
except in as far as they impact network layer issues of capacity and
latency.

>To be perfectly honest with you, I don't quite understand what you're

>in size. There's less overhead, too, of course.

Yeah, a BBS isn't a packet radio issue. As you note, usenet used dial up
uucp as a transport for years. Now it uses packet switched links to carry
nntp, but the user doesn't see anything different at the application level.
It is still just threads of messages that show up on a server. A BBS has
nothing to do with packet switching or packet radio. It's a layer seven
application. It need not be cognizant of the transport used. What happens
below the socket level on its own host machine is not relevant to its operation
as long as some sort of virtual connection exists. To call BBSing packet radio
demonstrates a fundamental misunderstanding of BBSs, networks, and
packet radio.

>BBSs and UseNet have the added advantage of being able to be used

>for some late night IRC chats, and the occasional WWW surfing looking
>for some information or entertainment. And for off-line use, even the
>outmoded old 1200 baud packet BBS network is fairly adequate.

Most of our users make no distinction between online and offline because
they are online all the time. Some applications run locally on their machines
while others run in a distributed fashion over the network. That's transparent
to them except in terms of response time. Their applications can locally
cache information gathered over the network if that's what they want. And
some do use slurp, nntp, and smtp to do that. Some things like realtime
audio and video conferencing or web browsing use the distributed resources
of the network. It's all bits to us.

>You (generic term for the 'Net usage advocates, not you in particular)

>fact that you're using something other than RADIO to interconnect your
>computers.

Oh good golly, you're right! Why we use RS-422 over *wires* to connect
our computers to our RF modems. And horrors, we use coax *wires*
to connect those modems to our antennas. Yep, we don't operate a pure
wireless system. Do you? But I'll guarantee you one thing, we do have
a more extensive and better performing wireless packet switched network
than you do. And that's our primary focus.

We do have an internet gateway which, like a phone patch, gives us
access to services and places we can't reach by a pure switched packet
wireless network. If you don't, then it is your users' loss. That's your choice
of course. If you don't want a phone patch on your repeater, or a gateway
on your network, I won't tell you that you should install one. The services
you don't wish to provide are a matter of your choice. But if your network
dies because you won't provide what your users want, don't come whining
to me about it.

Charles and Hank's BBS "network" doesn't provide the services our users
want or expect (which primarily do *not* revolve around BBSs). Nor is it
a packet network that would interface with ours and handle our packets.
Like the old uucp dialups, it is just a message forwarding application that
doesn't switch our packets. It has nothing to do with packet networking or
packet radio except perpherally. Packet networking, and particularly the
wireless application of that via packet radio, is our primary focus.

It obviously is not the focus of Charles or Hank, and apparently is
not yours either. Fine. Stay on the applications level and let us deal
with packet radio and switched packet networking. Just don't try to
instruct us on how to do something you so obviously don't want to
understand.

Bingo! "Be a ham" is what it is all about. To these appliance operators, "be a ham" means buy an appliance, plug it in, and never consider how it works or what it means or how to do it better. They don't really care about packet radio or switched packet networking. They just want to flame on a BBS. To those to whom "be a ham" still has some real meaning, learning. experimenting, and building better digital systems and networks is what it is about. TAPR has mostly served us well in that regard.

>Every project, except two, have been made available as a kit or fully detailed
>for others to build or create.
>
>I have always felt that the TNC-2, while being a great success, had a down side
>as well. Amateurs expected to much without any effort.

I agree. The TNC-2 was *expedient*, but it has been harmful to our efforts in the long run. It led users to view packet as an accessory use of their voice radios rather than as separate digital way of operating. And that de facto froze most users at a ridiculously low speed. It would have been better if TAPR had brought out a pure digital packet radio from day one (19.2 kb direct FSK was easily within our grasp at the time). I understand why that didn't happen, but with 20-20 hindsight it would have led us in a different and more productive direction. Now we find ourselves working against the inertia of an installed base who can't see the value of systems "faster than they can type", who think a HT is a perfect "packet radio", and who think that BBS forwarding is a packet network. Arrgh!

Now I don't have anything against appliances when they are used intelligently. And being able to turn a voice rig into an expedient "packet radio" has its uses.

But rather than being sideshows to the main event, they have been the tail wagging the dog. They have shaped amateur expectations of packet as a limited accessory use of amateur radio.

I don't understand the usefulness of your comments. The thread subject
is a quest for RTTY/CW keyboard software, not commentary on whether
attaining such an objective is appropriate or not.

One of the strengths of this hobby, which I have enjoyed for 38 years
now, has always been its many facets as well as the open-mindedness of
its participants. In my case I have several hobbies, ham radio and
computers are two of them. I just thought it would be neat to try some
CW from a keyboard - something different, perhaps an equipment
challenge, perhaps a segue into other digital modes of operation, where
the ear simply does not apply - melding the two hobbies a bit.

So ease up a bit, OM. I'm quite capable of hand-copying over 50WPM, and
armchair copying 65WPM+, while having a conversation with someone in the
shack. You're aiming your commentary on both a thread and a person that
does not deserve it.

I recall a recent request for a number of AMD AM-7910 300/1200 baud IC Modem chips ("world chips") posted by several people on these newsgroups.

Halted Specialties Co. in Sacramento has a bunch of them! New, static foam storage single pieces. Counted ten or more behind the counter, possible that they may have more in the back. They also have 2.4576 MHz crystals and other IC's to complete the simple RTTY/Packet Modem described in the 1988 (and other years) ARRL Handbook.....

>fit your description, do you think? Hell, how many people in Real
>Life fit that description?

Not many. But anyone of them could. It doesn't require extraordinary abilities. It just requires work. Most people are capable of work. Few people are even frightened by work. Why know plenty who can lay down right beside work and sleep like a baby.

>Also, you left out one important skill,
>diplomacy. All the initiative and drive in the world won't do much
>good if you can't motivate others. This combination is very rare, in

I think diplomacy is overrated. Determination is much more important.

>As the saying goes, If it was easy, anybody could do it. It's lots
>easier to sit around and bitch than it is to get involved. I know,
>I've done both.

I didn't say it was easy. But nearly any one of us is capable of doing it. It's a matter of motivation and attitude. If we have that fire in the belly, nothing will stop us. If we can't stoke that furnace, then nothing will be accomplished. It's a lot easier to stoke that fire if others around

you are stoked, and that's why groups form around such people. It is a feedback that keeps everyone's enthusiasm high.

You might try BTL version 1.51. It's available on simtel (www.simtel.com)
under MSDOS/hamradio. It's free.

Try some of the following web pages:

Glenn Elmore's Highspeed Radio Page
http://www.tapr.org/~n6gn

TAPR SS Web Page. Includes info on the 128Kbps+ FHSS project
and other stuff. Has a good biblio to other SS high speed sites
http://www.tapr.org/ss

The Ottawa 56K and other high-speed goodies
http://hydra.carleton.ca/

TAPR Packet Radio Home page -- some of these links are from here:
http://www.tapr.org/tapr/html/pkthome.html

Dale WA4DSY 56K site. Dale designed the original amateur 56K modem
http://www.wa4dsy.radio.org/

Another good source for high-speed packet radio information is the
Packet Radio Network in Slovenia page. They have been developing 38.4K and
faster systems.
http://www.hamradio.si/packet.html

I think you will find some interesting things on these pages as a beginning.
These are the ones I can remember off the top of my head.

Lots more out there if you look around further.

Also check out the various ARRL and TAPR Digital Communications Conference
Proceedings (http:///www.tapr.org/tapr/html/publications). There has been
a lot published in those over 16 proceedings. Just read over the abstracts.

Cheers - Greg Jones, WD5IVD

Source record: 25909

Hi!

I spent about a week installing the Flexnet. And I found some
important things:
- do not load the Flexnet drivers in your autoexec.bat. It does
not work at all on my computer.
- exit from Windows'95 by 'getting back to DOS mode', I don't know
how is it called exactly. Then load the drivers and run Windows again - do
not type 'exit' to get back to Windows. Type 'win'.
- I am using a Baycom modem driver - Flexnet hangs up after about
3 minutes of being connected. It does not decode anything for about 2
minutes and then starts working again. For next 3 minutes :)))
- The TCP/IP works fine, it does not hang, unless you are not
connected using AX.25. Maybe because I use Unproto frames for TCP/IP.
I heard that hanging up is caused by some bug in 'ser12.exe', so
with use of the soundcard driver it should not appear.

Don't know of anything that is native Win95 application, but there are
at least 2 DOS apps for RTTY available:

Blaster Teletype, BTL v1.51 at
http://www.geocities.com/SiliconValley/Heights/4477/
Freeware works very well for sending and receving RTTY - been using
it for several days and I like it so far. Runs as a DOS app under
Win95 but doesn't sit in the background too well - has to be the
active app in order for it to decode anything.

RITTY 2.0 by Brian Beezley, K6STI, at
http://www.megalink.net/~n1rct/rit2/rit2.html
Demo version available, can't figure out how much it costs from any of
the web info I can find (seems like basic info that should be there).
Apparently has a lot of DSP and other nifty features and will
interface with WF1B's contesting program.

For CW, theres a program called MRP that does a remarkable job of
decoding CW and has an interface for sending also. Demo version
available at
http://members.tripod.com/~PEeng/morse/
Sells for $50.

-Marty

Hi Fred!

That sounds good. I thinked a time ago about these posibility, but
found easy to use a separate subcarrier to tx data using wideband
manchester modem at low speed (38K4bps).

Anyway usually I work 1.2GHz ATV, since there is almost null 10GHz
activity here, and low interest to develop something non-comercial.

> This time the hardware involved is home made, designed and built by

Have you entered the baud rates in the FlexCtl window?
You need to set the baud rates there too.

Have you tried to run SMDIAG in a DOS box after Windows started?
What does it tell?

Tom

449. ICOM 820H 2M/440 Package PRICE REDUCED

For Sale
Icom 820H 2M(45W)/440(35W) Serial Number 01238 Purchased new in March of 1996 , VG-EX condition

Used primarily for space and terrestrial digital communications.
Great rig, the 9600bd performance is unmatched, according to QST.

Out of band TX/RX (I'm a MARS op) and satellite 9600bd modifications (both factory authorized and described) done.

Package includes:
- Comet CF-416 Duplexer - splits 2M/440 signal from a single feed line and dual band antenna.
- Icom AG-35 440 Preamp (never outside) - powered from IC820 via coax.

Asking $1050 FIRM + Shipping for the package.
(Prefer Atlanta area exchange)

450. ANNOUNCE: "NOSintro" is now on the web

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-19 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <ZeK+fTA3V3w0Ew6h@dowrmain.demon.co.uk>
Source record: 25914
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

"NOSintro--TCP/IP over Packet Radio" by Ian Wade is now available again,
after being out of print for several months. This 356-page book is still
the only detailed reference book of its kind anywhere on how to set up
and use the KA9Q Network Operating System.

The book has received widespread critical acclaim for its clarity, and
contains countless examples of keyboard commands and control files,
together with more than 80 clear, detailed diagrams showing how
everything fits together.

As a taster, we've now put the full text of 21 of the 35 chapters on our
web site: www.netro.co.uk. If you've visited this site before, please
call again. We've completely redesigned the site, with far more material
than ever before, and it's now much easier to find your way around.

(And, as an additional attraction, if you look hard enough, you'll even
find a rare picture of the author :-)

For full details on the book, and where to get it, please see:

http://www.netro.co.uk/nosintro.html.

454. Using BP-2M With TenTec for RTTY

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-19 00:00:00 UTC
From: David Van Wyk <KB0UDM@worldnet.att.net>
Message-ID: <6a0clj$kec@bgtnsc02.worldnet.att.net>
Source record: 25918

Any tricks for getting a BP-2M to key a TenTec Corsair? I am using Hamcomm and have had no trouble decoding RTTY signals but have not been able to get the modem/terminal software to key the rig.

Also when the mic connector is plugged into the rig I get constant low level noise. This happens whether the radio is switched on or not. Noise goes away when mic connector is unplugged.

Thanks in advance for any suggestions.

455. Pacterm 98?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-19 00:00:00 UTC
From: Larry Weaver <lweaver@yahoo.com>
Message-ID: <34C3D275.DC1AB564@yahoo.com>
Source record: 25919

I would like to know if anyone has any comments about this new TNC
software. I have been using WinPack for some time but would like to get
involved in HF Pactor again so I need something better than good ole
Pacterm in DOS. Being a Win95 application is a plus but is it worth time
to install. I have downloaded the three disks but am reluctant to
install since I really cant find much about the program.
Thanks for any comments,
Larry

Ham-Linux Mailing List

>>>> info ham-linux
Ham-Linux is a mailing list (reflector) open to all radio
amateurs (or others) for discussion of Ham-Linux.

TO:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ majordomo@qth.net
SUBJECT:
BODY:ï¿½ï¿½ï¿½ï¿½ subscribe ham-linux

To be removed from the mailing list:

TO:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ majordomo@qth.net
SUBJECT:
BODY:ï¿½ï¿½ï¿½ï¿½ unsubscribe ham-linux

To post information/questions to the list:

TO:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ ham-linux@qth.net

This mailing list is sponsored by Al Waller (K3TKJ).

Please address any questions to: k7on@qsl.net

QTH.Net Digests and Archives (for subscribers)
k7on@qsl.net

What about Digests and Archives?

A. Digests

All lists at QTH.Net have digests available.ï¿½

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.ï¿½

All list digests are configured for a size limit of 40,000 bytes.ï¿½
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting
the new message in the NEXT digest.

If you are switching from non-digest to digest, you must unsubscribe
ham-linux and subscribe ham-linux-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

TO:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ majordomo@qth.net
SUBJECT:
BODY:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ subscribe ham-linux-digest
ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ unsubscribe ham-linux

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index ham-linux-digest

and get a list of files that are available by request.

Here is an example:

>>>> index ham-linux-digest
total 116
-rw-rw----ï¿½ï¿½ 1 majordom 45ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ 14169 Sepï¿½ 2 18:09 v01.n042

NO GIMMIC. PLEASE READ!

DO YOU WANT TO MAKE MONEY FAST?

Of course you do, we all do!

Here's how to do so with little effort, and, yes IT'S LEGAL.

A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00!
So I thought, "Yeah, right, this must be a scam!" but like most of us, I was curious. Like most of us, I kept reading. Anyway, it said that if you send $1.00 to each of the 6 names and addresses stated in the article, you could make thousands in a very short period of time. You then place your own name and address at the bottom of the list at #6, and post the article to at least 200 newsgroups. (There are about 22,000.) or e-mail them to friends, or e-mailing lists...

No catch, that was it.

Even though the investment was a measly $6, I had three questions that needed to be answered before I could get involved in this sort of thing.

1. IS THIS REALLY LEGAL?

I called a lawyer first. The lawyer was a little skeptical that I would actually make any money but he said it WAS LEGAL if I wanted to try it. I told him it sounded a lot like a chain letter but the details of the system (SEE BELOW) actually made it a legitimate legal business.

2. Would the Post Office be ok with this...?

I called them: 1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL!
(See Title 18,h sections 1302 NS 1341 of Postal Lottery Laws). This clarifies the program of collecting names and addresses for a mailing list.

3. Is this moral?

Well, everyone who sends me a buck has a good chance of getting A LOT of money ... a much better chance than buying a lottery ticket!

So, having these questions answered, I invested EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps ... and boy am I glad I did! Within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just continued coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had a mad total of $1,000.00! In the third week I had over $10,000.00 and it was still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in.....

It's certainly worth $6.00 and 6 stamps!

So now I'm reposting this so I can make even more money! The *ONLY* thing stopping *ANYONE* from enriching their own bank account is pure laziness!
It took me all of 5 MINUTES to print this out, follow the directions, and begin posting to newsgroups. It took me a mere 45 minutes to post to over 200 newsgroups. And for this GRAND TOTAL investment of $ 7.92 (US) and under ONE HOUR of my time, I have reaped an incredible amount of money --
like nothing I've ever even heard of anywhere before!

'Nuff said!

Let me tell you how this works, and most importantly, why it works. Also,
make sure you print a copy of this article now, so you can get the information off of it when you need it. The process is very simple and consists of THREE easy steps.

==========
HOW IT WORKS
==========

STEP 1:

Get 6 separate pieces of paper and write the following on each piece of paper:

PLEASE ADD ME TO YOUR MAILING LIST.
$1 US DOLLAR PROCESSING FEE IS ENCLOSED.

(THIS IS KEY AS THIS IS WHAT MAKES IT LEGAL SINCE YOU ARE PAYING FOR AND LATER OFFERING A SERVICE).

Now get 6 $1.00 bills and place ONE inside EACH of the 6 pieces of paper so
the bill will not be seen through the envelope to prevent theft/robbery. Then, place one paper in each of the 6 envelopes and seal them. You should
now have 6 sealed envelopes, each with a piece of paper stating the above
phrase and an U.S. $1.00 bill.

Mail the 6 envelopes to the following addresses:

#1 - G. Rice
P.O. Box 572
Humboldt, AZ 86329
#2 - Michelle Owensby
3019 Elliot Street
Baltimore, MD 21224
#3 - Ralph Kabota
625 Whitney Ranch Dr. #1613
Henderson, NV 89014

#4 - Ron "Magneto" Foster
10010 Menlo Avenue
Silver Spring, MD 20910

#5 -JM McFall
451 Wellington Dr
San Carlos, Ca. 94070

#6 - Patrick Stevens
4802 forest DR.
Loris, SC 29569
STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number
6 on the list. (If you want to remain anonymous put a nickname, but the address MUST be correct. It, of course, MUST contain your country, state/district/area, zip code, etc! You wouldn't want your money to fly away, would you?).

STEP 3: Now post your amended article to at least 200 newsgroups. Remember
that 200 postings are just a guideline. The more you post, the more money
you make!

Don't know HOW to post in the news groups? Well do exactly the following:

HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:

The fastest way to post a newsletter: Highlight and COPY
(Ctrl-C) the text of this posted message and PASTE (Ctrl-V) it into a
plain
text editor (as Wordpad) and save it. After you have made the necessary
changes that are stated above, simply COPY (Ctrl-C) and PASTE (Ctrl-V)
the
text into the message composition window, after selecting a newsgroup,
and
post it! (Or you can attach the file, without writing anything to the
message window.)

If you have Netscape Navigator 3.0 do the following:

1. Click on any newsgroup like normal, then click on 'TO NEWS'. This
will
bring up a box to type a message in.

2. Leave the newsgroup box like it is, change the subject box to
something
flashy, something to catch the eye, as "$$$ NEED CASH $$$? READ HERE! $!
$!
$" Or "$$$! MAKE FAST CASH, YOU CAN'T LOSE! $$$". Or you can use my
subject
title.

3. Now click on 'ATTACHMENTS'. Then click on 'ATTACH FILE'. Find your
file
on your Hard Disk (the one you saved from the text editor). Once you
find
it, click on it and then click 'OPEN' and 'OK'. You should now see your
file name in the attachments box.

4. Now click on 'SEND'/'POST'. You see? Now you just have 199 to go!
(Don't
worry, it's easy and quick once you get used to it.) NOTE: All the
versions
of Netscape Navigator's are similar to each other, so you'll have no
problem to do this if you don't have Netscape Navigator 3.0.

! QUICK TIP!

(For Netscape Navigator 3.x and above)

You can post this message to many newsgroups at a time, by simply
selecting
a newsgroup near the top of the screen, hold down the SHIFT, and then
select a newsgroup near the bottom of the screen. All of the newsgroups
in/between will be selected. After that, you follow/do the basic steps,
stated below at this letter, except for step #1. You can go to the page

stated below in this letter and click on a newsgroup to open up the newsgroups window. Once you've done this, in the same window go to 'OPTIONS', and then mark 'SHOW ALL NEWSGROUPS' and 'SHOW ALL MESSAGES'. Now
you can see all the newsgroups and you can apply easier the above tip.

If you have MS Internet Explorer do the following:

1. Go to the newsgroups and press 'POST AN ARTICLE'. To the new window type
your headline in the subject area and then click in the large window below.
There either PASTE your letter (which it's been copied from the text editor), or attach the file which contains it.

2. Then click on 'SEND' or 'OK'. NOTE: All versions of MS Internet Explorer
are similar to each other, so you won't have any problem doing this.

GENERAL NOTES ON POSTING: A nice page where you'll find all the newsgroups
if you want help is http://www.liszt.com/ (When you go to the home page, click on the link 'Newsgroup Directory'). But I don't think you'll have any
problem posting because it's very easy once you've
found the newsgroups. All these web browsers are similar. It doesn't matter
which one you have. (But it makes it very easy if you have Netscape Navigator 3.0 or later. You may download it from the Internet if you don't
have it.) You just have to remember the basic steps, stated below.

BASIC STEPS FOR POSTING:

1. Find a newsgroup and you click on it.

2. You click on 'POST AN/NEW ARTICLE' or 'TO NEWS' or anything else similar
to these.

3. You type your flashy headline in the subject box.

4. Now, either you attach the file containing your amended letter, or you
PASTE the letter. (You have to COPY it from the text editor, of course, from before.)

5. Finally, you click on 'SEND' or 'POST' or 'OK', whatever is there.

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of
mail you receive. If you wish to stay anonymous, you can invent a name to
use, as long as the postman will deliver it.

**JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. **

ANOTHER EXCELLENT PROGRAM: "AutoPoster" http://www.spck.se/bulk/

MULTIPLE. POSTING ON HUNDEREDS OF NEWSGROUPS AT ONCE . The worlds most effective AutoPoster to Internets newsgroups!

A high speed Newsgroup Auto Poster/Newsreader for Windows 95
Autopost articles to more than 27,000 newsgroups
Super fast - up to 12,000 posting per hour on a single PC
Easy to run

Built in Special Functions such as:
Scramble Random Fake Sender
Rotate Unlimited Postings
Group Postings
Force Hits

==========
Now the WHY part:
==========

Out of 200 postings; say I receive only 5 replies (a very low example). So
then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my
name at #5 and only 5 persons respond to each of
the original 5, that is another $25.00 for me, now those 25 each make 200
MINIMUM posts with my name at #4 and only 5 replies each, I will bring in
an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies
each, I will make an additional $626.00! OK, now here is the fun part, each
of those 625 persons post a MINIMUM 200 letters with my name at #2 and they
each only receive 5 replies, that just made me $3,125.00! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1

and if still 5 persons per 200 newsgroups react I will receive
$15,625,00!
With an original investment of only $6.00! AMAZING! And as I said 5
responses is actually VERY LOW! Average are probable 20 to 30! So lets
put
those figures at just 15 responses per person. Here is
what you will make:

at #6 $15.00

at #5 $225.00

at #4 $3,375.00

at #3 $50,625.00

at #2 $759,375.00

at #1 $11,390,625.00

When your name is no longer on the list, you just take the latest
posting
in the newsgroups, and send out another $6.00 to names on the list,
putting
your name at number 6 again. And start posting again. The thing to
remember
is, do you realize that thousands of people all over the world are
joining
the internet and reading these articles everyday, JUST LIKE YOU are now!
So
can you afford $6.00 and see if it really works? I think so... People
have
said, "what if the plan is played out and no one sends you the money? So
what! What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, every day, with thousands of those joining
the
actual Internet. Remember, play FAIRLY and HONESTLY and this will work.
You
just have to be honest.

By the way, if you try to deceive people by posting the messages with
your
name in the list and not sending the money to the rest of the people
already on the list, you will NOT get as much. Someone I talked to knew
someone who did that and he only made about $150.00, and that's after
seven
or eight weeks! Then he sent the 6 $1.00 bills, people added him to
their
lists, and in 4-5 weeks he had over $10k. This is the fairest and most
honest way I have ever seen to share the wealth of the world without
costing anything but our time! You also may want to buy mailing and

e-mail
lists for future dollars. Make sure you print this article out RIGHT
NOW,
also. Try to keep a list of everyone that sends you money and always
keep
an eye on the newsgroups to make sure everyone is playing fairly.
Remember
that HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea
to
make the money!

GOOD LUCK to all and please play fairly and reap the huge rewards from
this, which is tons of extra CASH. Please remember to declare your extra
income. Thanks once again...

==========

LEGAL? ? ? (Comments from Bob Novak who started this new version.)

"People have asked me if this is really legal. Well, it is! You are
using
the Internet to advertise your business. What is that business? You are
assembling a mailing list of people who are interested in home based
computer and online business and methods of generating income at home.
Remember that people send you a small fee to be added to your mailing
list.
It is legal. What will you do with your list of thousands of names?

Compile all of them into a database and sell them as "Mailing Lists"
on the internet in a similar manner, if you wish, and make more money.
How do you think you get all the junk mail that you do? Credit card
companies, mail order, Utilities, anyone you deal with through the mail
can sell your name and address on a mailing list, unless you ask them
not to, in addition to there regular business, So, why not do the same
with the list you collect. You can find more info about "Mailing Lists"
on the internet using any search engine.

.." So, build your mailing list, keep good accounts, declare the
income and pay your taxes. By doing this you prove your business
intentions. Keep an eye on the newsgroups and when the cash has stopped
coming (that means your name is no longer on the list), you just take
the
latest posting at the newsgroups, send another $6.00 to the names stated
on
the list, make your corrections (put your name at #6) and start posting
again.

==========

NOTES:

*1. In some countries, the export of the country's exchange is illegal.
But

you can get the license to do this from the post office, explaining the above statements (that you have an online business,
etc. You may have to pay an extra tax, but that's OK, the amount of the incoming money is HUGE! And as I said, a few countries have that restriction.

*2. You may want to buy mailing and e-mail lists for future dollars. (Or Database or Spreadsheet software.)

*3. If you're really not sure or still think this can't be for real, please
print a copy of this article and pass it along to someone who really needs
the money, and see what happens.

*4. You will start getting responses within 1-2 weeks, it depends.

There are two EPROM's one goes on a plug-in circuit board which is
easily removed and then reistalled against the backplane.

The second EPROM goes on the board which lies behind the dials and
contains the switches for the keyboard and the pots for the analog
controls. Accessing these is a real bear.

460. Re: Gps ans HAM?

Newsgroup: rec.radio.amateur.digital.misc

Uwe,
A few moths ago, I read an article about a "built-in" APRS (Automatic Position Reporting System) with GPS. The unit was built into a cyclists helmut for a race. I seem to recall the GPS module information was available through the TAPR (Tucson Amateur Packet ???) organization. Anyway, suggest you look up their WWW page and ask for info if that is what you are asking.
Best,
h

461. Seeking Manual for Azden PCS-7500H

Newsgroup: rec.radio.amateur.digital.misc

From: mgrace@server.nlis.net
Message-ID: <En33nz.3Bq@server.nlbbs.com>
Source record: 25826

Or if manual not available, at least the instructions for how to program in the CTCSS tones. Azden apparently allows one to program from tone 00 to tone 57, but I have no idea which tone the tone "channel" would correspond to, since they obviously use more than the standard number of tones.

Thanks in advance for your help.

>>down to The Rest Of Us.
>
>Well, IMHO that isn't our fault.

Well, I seriously doubt that anybody at TAPR sat down and planned for things to have worked out that way...

On the other hand, I don't go for the idea that the folks at TAPR have been totally blameless. The "country club" status of TAPR has been well-known in the packet community for better than a decade now, and no-one there has taken any steps to restore TAPR to it's former relevance to the packet radio community.
By keeping the TAPR group an isolated "small pond", certain participants could enjoy the sensation of being a "big fish". The general packet radio community ends up being shut out because that woulds leave us with too large a pond.
What's so "big dog" about being in a "country club" where just ANYBODY can be expected to show up?

In other words, I am saying that TAPR has been dedicated to massaging the delicate egos of a small group of alleged "movers and shakers" much more than it has been dedicated to the amateur packet radio community in a general sense. That's what "country clubs" are all about, and that is what has held TAPR (as an organization) back from being much more useful and relevant to the amateur packet radio community.

So though I doubt that anybody sat down and seriously planned on making TAPR what it (sadly) is today, they sure as heck didn't sit down and plan on making it really serve the needs of the ham digital community either. That got lost in the excitement and exclusiveness of the "country club".

>The software and hardware is available in all the instances. You just have
to
>gather all the information which is available and then be a ham and do a
little
>experimenting. If you expect everything to be handed to you, then that is
what
>non-licensed systems are about and they typically cost a lot more.

My feeling is that if TAPR were half as interested in furthering amateur packet radio as they are in massaging their own egos, they would have found it within themselves to BE SURE that advanced equipment and software was packaged especially for use by large numbers of hams.

The statement about TAPR doing experimental work and expecting the general packet community to do all of the development work is pretty asinine, and accurately points out the source of TAPR's present lack of relevance to the packet community. When TAPR followed through (long ago) on experimentation AND development, we had - The TNC2.

The TNC2 was a wild success, and I find it amazing that nobody at TAPR has since had any curiosity as to why that one big success was never followed up with anything better. Instead, in the intervening years, TAPR has diddled around with undeveloped experimentation, petty internal squabbles and a big PR campaigne so everybody would be sure to know how great TAPR is.

A mutual backslapping society.

>Every project, except two, have been made available as a kit or fully detailed
>for others to build or create.

I'll go along with the idea that those kits represent the sum of TAPR's tangible accomplishments since the TNC2, but I don't think of that as a "bragging point". To me, it just shows that TAPR has been flopping around in an undirected fashion.

>I have always felt that the TNC-2, while being a great success, had a down side
>as well. Amateurs expected to much without any effort.

That statement accurately reflects the "reasoning" which has kept TAPR from being relevant and useful to the packet radio community for quite some time now.

It's both asinine and ignorant to expect every packet op to be an experimentor. Only the isolated, insulated "country club" society of TAPR could produce such a statement.

Hi,

I have sent a response some days ago on this group but it seems to have
been lost...

- PLUG THE "TF" EPROM IN YOUR TNC
- Set Winpack to "TF emulation"

You will have 4, 8 or 12 channels available. It works very very well.

Well, I've got a Motorola EVM50002 DSP board, for which I have:

VHF & HF modems(1200bps, 9600bps, QPSK, 300bps, etc.)
Noise-reduction, notch filters, etc.
DTMF decoders
Pactor, RTTY software
etc.

Total cost? About $100.00, including cables, because of TAPR efforts
to make the EVM board a good platform for amateur experimentation. The
last time I looked, a bare-bones non-Baycom type TNC cost, at a minimum,
about $120.00. It's not widely available? Call up Arrow electronics, or
ANY other distributer, and get yourself an EVM board or two for about
$130.00.

Explain to me again how new technology is unaffordable, and TAPR
isn't helping?

- Rich

Hi:
Does anyone have any experience hooking up
an AEA PK-232MBX to a Yaesu FT-1000. I am
interested in using the rig for RTTY and PACTOR
and AMTOR. I am a little concerned on making
sure all is done correct and would appreciate
any helpful hints or observations.

I've put details of a simple, low-cost DIY DSP system using the ADI ADSP-2104 up on my Web site:

http://www.lfheller.demon.co.uk/diy_dsp.htm

I wire-wrapped it on a 100 mm square piece of prototyping board, and it cost me about #35 for the chips (the ADSP-2104, AD1847 codec and a 2K X 8 NVRAM), which are all available from Maplin, in the UK.

Wonderful. Where is this marvelous new toy advertised? In which QST
or 73 issue is the article explaining what it is, how it works,
schematics and parts lists, and where to buy it? Where are the
messages in the packet BBS network telling us how this will replace
and improve what we have now? Where are the messages in THIS forum,
for that matter, spreading the word about this amazing gizmo?

And why do you say the total cost for all the goodies you name is
$100, and then say I have to pay $130 to get the bare board?

> Explain to me again how new technology is unaffordable, and TAPR
>isn't helping?

"Affordablility" is more than just out of pocket cost. Assuming this board will function on a mountaintop as a node controller, and will replace the current system with a minimum of grief, and that it'll use existing radios without TOO much modification, then who's going to assemble all the parts, solder them all together, troubleshoot them, etc, for the 10 or 20 or 30 ports needed for even a relatively modest network? The folks who actually build, support, and maintain this stuff usually prefer to buy as much stuff off the shelf as possible, because their time is too valuable to spend designing and building tons of kits. It takes enough time just to interface, install, and test it all, without having to build it, too.

Of course, unless your device is completely backwards compatible with existing stuff, you have the added headache of getting all the users to build it, too, or find a way to interface the old net with the new one, with all the redundancy that requires.

Until and unless this stuff is available commercially, and widely advertised, it's just Pie In The Sky, for all practical purposes. Even the commercial stuff is not being properly promoted. Pac-Comm builds some very nice gear, but even though I've purchased a bunch of TNCs from them, they don't advertise, and they don't even send me a brochure occasionally. If I want to buy some new trinket they build, and assuming I somehow even hear about it, I have to find their phone number, call them up, and get them to send me a price sheet.

(Hmmm, maybe they've got a Web Page. I'll have to go looking for it, but I've never seen a link to them from any ham sites, so I'd guess they don't have a site.)

Now, no doubt, Gary, a professional in the electronics field, will jump in here with his usual condescending comments about how I, an old ex-logger who first started playing with radios at the age of 40, could have a GRAPES-type network in my area if I'd just get off my ass and build it. Too bad, fellows. This is Real Life, not some engineer's wet dream. People build kits and design projects for fun, relaxation, and education, not to support networks. There may be exceptions in small areas, but they _are_ exceptions, IMO.

Try looking at comp.dsp. Try looking at the TAPR website. Is TAPR
supposed to take out 4-color ads in Esquire to advertise their efforts?
If you want to learn about the latest technology, why aren't you going
out and LOOKING for it, instead of expecting it to sneak up behind you
and bite you? Amazingly enough, lots of people heard about the board
without having personal phone calls made to them.

>And why do you say the total cost for all the goodies you name is
>$100, and then say I have to pay $130 to get the bare board?
>

The price difference is because TAPR made a good effort to help
Amateurs get a bulk-purchase deal on the boards. You know - that
same TAPR that you claim never does any good for the Amateur
community? That same TAPR that is now providing forums for discussion
of DSP, and FTP sites for archiving the DSP software modems and filters?
The same TAPR that constantly gets other bulk-purchase deals on
equipment? The same TAPR that put out the MIC-E for the APRS folks,
the Trakbox for the satellite crowd? The same TAPR that helps to sponsor
the Digital Communications Conference every year? (Do you have ANY
idea how much time and effort it takes to make the arrangements for a

national conference?)

The ONLY assembly needed to make the board function is a set of cables,
and 3 or 4 transistors on a piece of perf-board. Period. It's a pre-assembled
board. If you want to get really snazzy, you can install a set of blinky LED's, too. Is
that expecting too much of your vaunted BBS operators? It took
me about 30 minutes to get a fully-functional 1200bps modem running.
Later on, it took about 5 minutes to install a new flash-ram chip for
permanent storage of some modems on the board itself. (Of course, that
required that I be able to solder in a DIP socket. You appear to think
that the average amateur in incapable of such of complex task.)

>

Most of the modem software for the DSP uses a KISS interface. (And
a KISS interface that doesn't lose its mind every now and then, like most
of the commercial hardware TNC's.) It's completely backward compatable
with any system that uses KISS. No brains required, period.

Paccom isn't allowed to send out their ads on the Amateur networks,
which leaves them only mainstream venues to advertise.

Guess what? Advertisements cost LOTS of money. You obviously have
access to the Net, and can EASILY get the Paccomm and TAPR web pages.
Any search engine will point you to dozens of vendors of Amateur
equipment. Of course, if we had the same sort of functionality
in the Amateur world, we could do it THERE, too, but a data archive
accessed over a 1200bps link isn't terribly useful.

Now, for all we know, TAPR may have sent out messages about the EVM over the Amateur BBS
network, but they got lost in the ether, like they typically seem
to do. I sent myself 2 test messages from a Buffalo BBS to a Rochester
BBS 4 days ago, and they still haven't shown up. We're 60 miles apart.
Isn't that this a wee bit ridiculous? Now, since your standard
response is to comment that I must have offended some Lockout Lid - I
suspect not. The only BBS message that I've sent out under my current
callsign is a request for assistence from amateurs in Maryland to be
on the lookout for a missing family member of a friend. It's a pretty good
guess that a "Lockout-Lid" would not take offense.

>(Hmmm, maybe they've got a Web Page. I'll have to go looking for it,
>but I've never seen a link to them from any ham sites, so I'd guess
>they don't have a site.)
>

Like I said before - being proactive is a wonderful thing. It may even
get you out of the 1980's. www.tapr.org is a great place to find out
how the world has progressed since the Z-80 based TNC came out. www.paccomm.org
is a fine place to see the commercial implementations of some of that
same technology. Of course, that's going to require that you use the
wired internet to get Amateur Radio information, but, until amateurs can
disseminate the information themselves, in bulk, in a timely fashion,
over their own networks, the wired internet is the only alternative to
get that information.

>Now, no doubt, Gary, a professional in the electronics field, will

>exceptions in small areas, but they _are_ exceptions, IMO.

We're building a 56K network here in Rochester that is completely
plug-and-play with GRAPES modems, PI/2 cards, and xverters. The ONLY
construction necessary is building a 15-pin straight-through cable for the
PI/2 card to the modem. None of those confusing rx/tx data line crossovers,
even. The total cost per node is about the same as
a cheezy 1200bps BBS system - $600.00. 56K is enough to run data, digital
voice, compressed video, etc. It sure would be nice for some public
safety events to be able to send video beyond the range of ATV, wouldn't it?
Is $600.00 that so expensive, and difficult, for the BBS ops out there for
over 10 times the performance, and easier setup?

The main players in our growing network aren't professionals
in the electronics field, either. I just started in Amateur Radio 5 years
ago, and couldn't tell resistor from a capacitor. It's a plug-and-play
world out there, if people only would just get off their backsides.

On Feb 20 each year we celebrate the beginning of FSK RTTY privileges on the HF bands and toast the memory of the RTTY pioneers who worked so hard back when it was hard work to get on RTTY.

This is not a contest, there are no logs to send in or scores to keep.
There are no rules, just suggestions:
Use a mechanical teleprinter if you can
Use 850 Hz shift if you can, at least part of the time
Use vacuum tube gear if you can
Wallow in nostalgia
Have fun!

Use the usual frequencies where Baudot operators hang out, and the time of the event is very casual; but Feb 20 is the day as it all started on Feb 20, 1953.

I am getting rid of packet stuff I can no longer use because I no
longer live in Los Angeles, and because I bought a new HF rig.

Kantronics Data Engine with 9600 baud and 1200 baud port
(can run both simultaneously)

Kantronics D4-10 crystal controlled 440Mhz 9600 baud radio
crystals for 439.025 (Los Angeles) and any other left overs.

Last used 5 years ago. Stored neatly. Looks good.

Sold as a package for $555, shipping included, within USA.

This is a deal compared to retail: $700 retail just for the DE and D4-10,
then you have to pay extra for the 9600 baud board.

Does their design have the PNP transistor for driving the CTS output,
like the "real" Baycom modem has done for quite some time? Most Baycom
modems from UK suppliers omit that increasingly important feature.

Frankly, if you are waiting for QST or 73 to cover cutting edge (or even
current techology) adequately, you probably are in a for a wait. There
is this thing called "The World Wide Web". You may have heard of it.
You can find all sorts of things out there.

For information about the Motorola EVM boards, try:
http://www.tapr.org/dsp/evm56k/index.html
This contains alot of good pointers to information and software for
use in the realm of amateur radio.

A few moments of searching the Arrow website lists the current price for
a Motorola EVM56002 board as being about $149. Admittedly, a bit higher
than Greg first mentioned, but still in the TNC-2 ish price range, and
since this is a programmable device, it will prove to be more versatile.

Another cheap DSP board I know a number of people have been using is the
EZ-KIT LITE, by Analog Devices. It is based upon the ADI 2181, which is a
cheap cute little DSP. They have assemblers and board, with two channel
A/D for < $100. Want to spend $200? They have a better one, the SHARC,
with floating point that really cooks.

>And why do you say the total cost for all the goodies you name is
>$100, and then say I have to pay $130 to get the bare board?

$149, assembled, and ready to go. Sure, you are gonna have to rig some
power supplies and cables...

More importantly, you are going to have to invest some time to figure out how it all works. For me, that is fun.

Whine, whine, whine.

Remind me what is your hobby again? Is it sitting around like Ozymandias, admiring the towers you have built while the desert swallows them, or is it to experiment and build networks? If your time is valuable, spend it doing something you like, or something that makes money, so you can do more of what you like. If you've decided to have a hobby, and it makes you upset, pick a different hobby, or at least, rethink your current one.

>Of course, unless your device is completely backwards compatible with
>existing stuff, you have the added headache of getting all the users
>to build it, too, or find a way to interface the old net with the new
>one, with all the redundancy that requires.

Ah, backward compatibility. The mating cry of the Luddite. The triumph of what is comfortable over what is good.

>Until and unless this stuff is available commercially, and widely
>advertised, it's just Pie In The Sky, for all practical purposes.

Perhaps Pie in the Sky is preferable to Shit on Your Shoes.

>Even the commercial stuff is not being properly promoted. Pac-Comm

>number, call them up, and get them to send me a price sheet.

I doubt that PacComm is exactly rolling in dough. Advertising and brochures cost money, and if it raised the price of your TNC $20 so that they could advertise, I bet you'd complain bitterly. The market for these devices is not large.

>(Hmmm, maybe they've got a Web Page. I'll have to go looking for it,
>but I've never seen a link to them from any ham sites, so I'd guess
>they don't have a site.)

www.paccomm.com. That was my first guess about what their address should be.

>exceptions in small areas, but they _are_ exceptions, IMO.

Digital signal processing is interesting stuff. The fact that you can use a simple $100-ish dollar board to do implement 1200 and 9600 baud modems, noise cancellation, RTTY demodulators, and a host of other useful gadgets is COOL. These cheap DSP boards will not get you immediately to 56Kbaud or higher, because they are mostly audio-rate only. But they are good platforms to experiment on, and practical to use in the shack. You will learn about what digital communications CAN be. I think it's quite snazzy :)

Hi all,
i am looking for the Binary code of the version of this Node Software call
" X-1J4" The Net .
I am using 2 tnc .A KPC-3 and KPC-2 and i will make a node with one and
if i can find
on the net news the copy of the EPROM that have this X-1J4 i will
appreciated any help.

Bye from Rimouski,Quebec

Same reason people still eat meat. They keep reading the same old trash, andgoing to the same old places. Blinders, etc.

Instead of sitting on here every day telling us how smart you are, or bitching about this or that, go to a few Web pages and do some searches on other subjects. Life does not revolve around a BBS node.

> Of course, unless your device is completely backwards compatible with
> existing stuff, you have the added headache of getting all the users

yawn.

> Until and unless this stuff is available commercially, and widely
> advertised, it's just Pie In The Sky, for all practical purposes.

Most things Hams do is not practical. Don't wait for advertisements, go tothe Web page. Heck this stuff was news a year ago! I bought two and they are great fun! Right now I'm playing with it attached to an old X-Band radar from the Virginia Highway Patrol. Great FFT...

> Even the commercial stuff is not being properly promoted. Pac-Comm
> builds some very nice gear, but even though I've purchased a bunch of
> TNCs from them, they don't advertise, and they don't even send me a
> brochure occasionally.

Word of mouth is advertising. Ham gear is cut-throat, there's not enough Hams to support advertising in the normal form. How many Astronomy Ads do you see in daily life? How many Radio Telescopes do you see advertised? Do a Web search on Radio Telescopes and you'd be surprised at what's available! How about a .34 dB NF (woo-hoo!)

482. XPWIN & N1RCT RITTY

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-21 00:00:00 UTC
From: guygordon@juno.COM
Message-ID: <19980121.155244.4543.3.guygordon@juno.com>
Source record: 25846

Recently, received an education on software used with data controllers in HF digital modes. In several A/B comparisons XPWIN had fewer errors and omissions than PcPakratt. Quite unbelievable. Until now, I did not realize that software CAN make a difference. In addition XPWIN has an interface for my XCR.

Has anyone had extensive experience with the N1RCT "RITTY" software. I was informed that the software is superior in capturing HF data transmissions that are "unreadable" by any analog (that includes almost 95% of the TNC's on the market today) controller.

What say you?

Thenet X1j4 is available from ftp.ucsd.edu in /hamradio/packet/thenet, but
it is not compatible with Kantronics TNCs, only the TAPR TNC-2 and clones
plus the AEA PK-96.

Heck Glenn, I'd buy two of 'em for $200, if the "total cost" is really that low. I plug them into ... what?
Richard mentioned "cables", what do they connect to?
These are ready to run with all required firmware, cabinet, connectors, etc?
"No assembly required", "Batteries included" ?
Manufacturers warranty?

Sounds a lot cheaper than the $175 I've been paying for used KPC-9612s.
How do they compare to the KPC-9612 at 9600 baud?
What interface firmware is available? Assume KISS, but is there anything else?

i.e. tell us why these might be cost-effective.
It sounds like it has about the same capabilities as presently available
TNCs, perhaps at a lower price. If that is true I can use a bunch.

> And why do you say the total cost for all the goodies you name is
> $100, and then say I have to pay $130 to get the bare board?

That WAS a bit confusing.

Guess I missed where he said this was a kit.It would have to be a lot cheaper than $100 to compete with existing
commercial TNCs, or else offer a lot better capabilities. From the
list given above, it looked a lot like your basic TNC.

> Of course, unless your device is completely backwards compatible with
> existing stuff, you have the added headache of getting all the users

I'm not even sure there are any exceptions anymore. 56k networking has
been available commercially for quite awhile (e.g. PACCOM) but has made
almost no impression on the ham networks. Seems to me that hams are
simply no longer interested.

>bulletins. Most hams look at that and say, "I can't type faster than
>1200 baud, so why should I hassle with adapting 9.6 kb to a radio not
>designed for it?"

A lot of BBS access these days is "download and read offline". The BBS
sends an unproto with message titles as they arrive, these are picked up and
stored by client software so that hooking up to the BBS to scan message
titles is not required. The user ticks off the ones he'd like to see, then
his client software autoconnects, downloading the messages using the same
compression methods BBS's use to forward with each other. This works better
at higher speed.
All packet BBS programs have the ability to act as file servers as well as
message bases, and many do. In addition, access to callsign data on a CD is
quite common.
Then there is "TeleText", games, satellite servers, grid-square calculators,
ect. ect.

Sure, some hams still connect to the BBS and do keyword searches, ect. for
specific info, or manually enter messages without running them through an
editor first, but that's really just a matter of preference. Better ways
exist, and are regularly utilized.

You don't appear to have much of a clue as to what actually goes on with the
BBS's you condemn.

In any case, my "BBS ports" are also "network resources", in that my BBS is
a server which runs in the same machine as my node software. Nobody has to
use my BBS in order to use the node. A lot of guys use my node to get
"hooked into" the ROSE network to the west, and use other mail servers
there. That's what the node is there for.

Source record: 25852

From Stan Horzepa, WA1LOU, TAPR APRS SIG Chair.

To more easily obtain information about new APRS software and firmware releases, as well as, announcements about APRS conferences and forums, TAPR has set up a new e-mail listserv called APRS NEWS. The APRS NEWS list is not a discussion group (the APRS SIG and APRS QSY SIG serve that function); rather, it is intended as a place for software and firmware authors to post announcements concerning the release of their latest APRS wares, and as a place for
organizers to post announcements concerning APRS conferences and forums.

For those individuals that had requested a list that contained just APRS related announcements, this is were you should be, since the amount of daily e-mail should be low as compared to the very busy main APRS SIG list.

To subscribe to the APRS NEWS, surf to the bottom of:

http://www.tapr.org/tapr/html/sigs.html

or send email to:

listserv@tapr.org

with the following line in the body of the message:

subscribe aprsnews YourFirstName YourLastName

>same TAPR that you claim never does any good for the Amateur
>community? That same TAPR that is now providing forums for discussion

I never claimed any such thing. Maybe you should actually read what I
say, rather than what you think I said.

>of DSP, and FTP sites for archiving the DSP software modems and filters?
>The same TAPR that constantly gets other bulk-purchase deals on
>equipment? The same TAPR that put out the MIC-E for the APRS folks,
>the Trakbox for the satellite crowd? The same TAPR that helps to sponsor

>the Digital Communications Conference every year? (Do you have ANY
>idea how much time and effort it takes to make the arrangements for a
>national conference?)

So if they've got this much time, energy, and money to throw around,
why can't they do a bit of promotion and advertising? Could it be
that they don't really WANT the unwashed appliance ops to have access
to the secret goodies? Do they want to keep them all in the control
of the selected elite? That's probably not true, but that's sure the
way it looks. Web sites are all well and good, but they're hardly the
way to get a message out to the thousands of amateurs needed to make a
success of any new packet innovations.

>>tons of kits. It takes enough time just to interface, install, and

>which leaves them only mainstream venues to advertise.
>
> Guess what? Advertisements cost LOTS of money. You obviously have
>access to the Net, and can EASILY get the Paccomm and TAPR web pages.

TAPR is no problem, but I spent a half hour on Alta Vista last night,
and did not find Pac-Comm anywhere in the first several dozen
listings. That is not "EASILY" in my book.

Anybody with a basic understanding of Marketing 101 knows that any
retail business MUST advertise to get sales. Kantronics and MFJ have
packet ads in QST every month. Where are the ads from Pac-Comm?
Where are the articles from TAPR?

>Any search engine will point you to dozens of vendors of Amateur
>equipment. Of course, if we had the same sort of functionality
>in the Amateur world, we could do it THERE, too, but a data archive
>accessed over a 1200bps link isn't terribly useful.

It's not very useful if nobody _uses_ it. I used to read all sorts of
things on packet radio about what TAPR was doing. That's all
disappeared now. They don't even tell us what they're doing here in
THIS newsgroup, unless somebody like me or Charles comes along and
goads them into it. That's no way to promote change or progress.

> Now, for all we know, TAPR may have sent out messages about the EVM over the Amateur BBS
network, but they got lost in the ether, like they typically seem

Hogwash. I've seen hundreds of messages from the other side of the
coin. I've seen many messages from Charles until he got censored by a
Lockout Lid. If TAPR had been putting information into the system,
I'd have seen at least some of it. Of course, they don't put it on
the BBS system, because they have nothing but contempt for it.
They've admitted as much right here in this forum.

>to do. I sent myself 2 test messages from a Buffalo BBS to a Rochester
>BBS 4 days ago, and they still haven't shown up. We're 60 miles apart.
>Isn't that this a wee bit ridiculous? Now, since your standard
>response is to comment that I must have offended some Lockout Lid - I

It's not necessary for YOU to offend anyone. If a Lid has locked out
any BBS in the link, the chain is broken.

>>(Hmmm, maybe they've got a Web Page. I'll have to go looking for it,
>>but I've never seen a link to them from any ham sites, so I'd guess
>>they don't have a site.)

> Like I said before - being proactive is a wonderful thing. It may even

And like I said, it was unproductive, since I was unable to find the
site.

>get you out of the 1980's. www.tapr.org is a great place to find out

I've spent 20 years trying to drag ham radio into the 20th Century,
and I've got the scars to prove it. As I've said before, I'm pretty
much burned out on such a thankless job.

>how the world has progressed since the Z-80 based TNC came out. www.paccomm.org
>is a fine place to see the commercial implementations of some of that
>same technology. Of course, that's going to require that you use the
>wired internet to get Amateur Radio information, but, until amateurs can
>disseminate the information themselves, in bulk, in a timely fashion,
>over their own networks, the wired internet is the only alternative to
>get that information.

Oh, CRAP! Ham radio managed to get along for most of a century before
there ever was an Internet. Let's get real here, shall we?

The above remarks are a lovely rationalization for the fact that
nobody's doing anything effective in getting the word out on all this
wonderful stuff. Either it's not so wonderful as we've been told, or
the people involved are not qualified in the techniques of properly
marketing a product or service to the potential customers. Many hams
are not on the Web, and only a small minority of those who are on the
Web have the time or inclination to go digging up arcane information
about packet.

> The main players in our growing network aren't professionals
>in the electronics field, either. I just started in Amateur Radio 5 years
>ago, and couldn't tell resistor from a capacitor. It's a plug-and-play

Well, after you've been fighting apathy, ignorance, stupidity, and
political intrigue for twenty years instead of five years, get back to
me on how you feel about it.

>world out there, if people only would just get off their backsides.

Exactly. Since it's YOU who have the experience and information about
this amazing gizmo, why haven't YOU gotten off YOUR ass and written it
up for 73 Magazine, who'd be happy to PAY you for a decent article
with pictures, schematics, parts lists, etc? Hell, you haven't even
written it up HERE! Nobody's even MENTIONED it, as far as I've
noticed, until it popped up in this thread.

No, it's easier for you to blame me for being lazy, when I'm the one
looking for answers. Seems like nobody's interested in anything but
insulting the people who've utilized the old technology to the best of
their abilities.

And while I'm on a rant here, I read the URLs that Greg referenced in
reference to an earlier thread. While I didn't see anything that
justifies Charles' namecalling, neither did I find anything that
refuted the basics of what he's saying. In fact, the article that
Charles quotes seems to pretty much say what he says it does; that the
present radio network would be used as a _backup_ for the wireline

network that Greg was promoting. Everything else was just
rationalization for that premise.

Good news Rich and others who own the EVM56002 DSP boards.

As a note to others reading, you can get the Eval board already assembled and
operational from several distributors which include Wyle, Arrow, and some
others. That is the $130. When Rich said board, he meant built and tested
board. It is not the most powerful thing in the world, but it does the trick
for a lot of current applications. As DSP technology continues to ramp up, I
am sure we will see newer platforms in the future. The issue is that people
are creating librarys and suites of software now that will be able to be ported
in the future -- so amateur radio related DSP software is only going to get
stronger as the years go on.

If you don't want to build cables and the rest and you were a member of TAPR
you would be reading about this in the upcoming TAPR PSR.

Always glad to have a forum to discuss the interesting stuff TAPR is doing with
its members.

Cheers - Greg

TAPR EVM56002 Interface boards and Enclosure Kit
PSR #69, Winter 1998. p. 21.
(Just went to the printers and should be mailed to the membership in the next
two weeks or so.)

TAPR will be releasing a EVM56002 Interface with enclosure kit sometime in
the Spring. The interface kit has been discussed for the last year,
with a group coming forward late in 1997 to complete the design process.
At this time, four units are in testing and the enclosure is being ready to
be manufactured. The enclosure is of a similar design as the DSP-93 box
(http://www.tapr.org/tapr/html/dsp93.html).

This design of the radio interface for the Motorola DSP56002EVM is based on Johan Forrer's, KC7WW, original design (see http://www.tapr.org/~n7hpr/evm/evmpcb.pdf last revised February 1996). In February 1997, Douglas Braun, N1OWU, released his software suite for the EVM and revised his interface to be more flexible than Johan's. The TAPR interface is a happy medium between Johan's and Doug's design. The goal is to make the interface flexible for past and present code developed for the EVM and to create a flexible programming interface for future programmers.

If there is enough interest, TAPR might try to keep a small quantity of EVM boards at the office for those who are interested.

PICTURE 8 (4"w x 2.499"h)
Side View of Unit (front is to right). The EVM sits in the middle of the enclosure with the radio interface to the rear and display to the front.

PICTURE 9 (4"w x 3"h)

I guess we are just not doing it were you are reading.

I could take the time to list the articles that got published this last year referring to TAPR and what was happening, but it probably isn't worth the time. Stan, WA1LOU, QST and Don, N2IRZ (?), of CQ/VHF cover a lot of what TAPR is doing in their digital columns. The real place to find out what TAPR is doing is to join and get the PSR newsletter.

Glen, we can always use help from people writing articles about subjects and projects. Just not enough time in the day for everyone to do everything. Plus, you can get okay money for writing various things and getting them published in the various mags.

As you know, TAPR is not just one person or a small group of people. The problem I face every day with projects and tasks within TAPR is that most of the time the developers are really more interested in coding and building -- not writing articles. We might get a paper submitted to the ARRL and TAPR DCC and we typically get something to put into the PSR as well. Experimenting (playing) is what they do for fun, not writing for others to read about what they are doing. In some cases, they could care less if anyone else besides there small group ever did it. It is enough satisfaction for them to have accomplished it locally. I know of at least two really talented developers that intentionally don't want to announce anything they are working on and rarely make it available, because of major grief that have taken in the past. It is sad, but another example of hams getting other hams to basically pull out of the general community. Not everyone have as thick as skin as I do and others.

It takes a lot of time to write and for some it is not as much fun as building. TAPR's job is to provide a conduit to our members about what other members and groups are doing and using our resources to make things available to a larger set than just local friends. While one of our goals is to help amateur radio as a whole, the emphasis is still towards helping those that are members and become part of the process. As a membership based organization you have to

focus on those that brung you -- the old saying goes. Getting articles into the PSR and hopefully then transferring those to the major mags is an ongoing effort.

If you want to volunteer as a writer of articles or product information press releases to magazines, I could sure use the help.

Cheers - Greg, WD5IVD
Pres TAPR

P.S. Hi to all those TAPR members reading this! Thanks for supporting!

Woaaaa. TAPR doesn't require advertising, because we live by our membership. We live by word of mouth. We live by article and announcements, but we don't maintain an extensive ad campagin. The most advertising we do in a year can be found in the classified section of QST, CQ/VHF, and some others. Also, we get by on 20% overhead on stuff, unlike a commercial group. This allows TAPR to do very small offerings and still break even or make a small profit into other things.

I already covered the articles thing in a previous message.

The information is out there. We post things to this group. I wasn't doing a lot of it, because my feed dropped and I am now only getting back on. The real place to get information is to join and get the TAPR PSR. We focus on that and the web page.

It is impossible to promote change or progress by mass means. The only way you promote change and progress is by supporting the people who make change happen. Just read "Communication Networks: Towards a New Paradigm for Research" by Everett M. Rogers and D. Lawrence Kincaid. While you might this this is a technical book it deals with human communication networks and all sorts of different methods of communications and how things get changed by communications. USENET is great, e-mail lists are great, but overall they are only very good information conduits to a pretty small group of people. You can read about how technology change happens in the book. What we are doing here is only one of three necessary issues. I wrote about this several issues ago in the PSR (http://www.tapr.org/tapr/html/presidents_corner.html).

>> Now, for all we know, TAPR may have sent out messages about the EVM over the Amateur BBS network, but they got lost in the ether, like they typically seem

Hundreds of messages is right. I only have time in the day to post maybe one message to every twenty -- even whet I was on regularlly. I hold down a job, go to school full time at the PhD level, and run TAPR in all the spare time that is left. This message here has taken me maybe 40 mins to do. I probably should have been working on the graphics for the new wirless networking book by John Ackermann we are doing.

As to Charles being locked out -- he can't be locked out. He can either use TexNet node in Denton, Texas -- which I maintain -- or the TexNet node in Sherman. The TexNet node, since it was written by the group I used to be Pres of (TPRS), can't lock anyone out -- doesn't have the code in it to lock out anyone. It might be the issue that Charles can't get to the Denton node now, due to hardware problems. Why Charles would say he can't get access is beyond me.

As to posting things on to the BBS network. Again, does anyone want to do it ? We found someone a year or two ago and they did it for about four months until they couldn't take all the negative comments about them and their family that some people started putting out on the PBBS network, so they stopped. Fine. Amateurs doing it to amateurs again.

If someone wants to start posting information about what TAPR is doing onto the PBBS network, they just have to volunteer to do it ? Want to Glenn ? Someone else ? There are several ways to do it.

As to BBS postings. We can't put a lot of what we do onto the BBS network, because I would consider it commercial in nature. Have always felt that way. We can't say we have a new kit or publication. I think some feel it would be okay, but I think it goes outside of what we should be doing. There are other ways for people to find out what TAPR is going. Join. We put out information on the DCC and other things on Packet, but a lot of time we ask the local/regional group to do multiple distribution to the state or some general area.

I get accused a lot of not liking BBS operations, because I don't have a PBBS e-mail anymore. The reaons for this is simple, I started getting to many messages that again I considered to be business when I became Pres of TAPR. I use to be on BBS all the time before then. I helped to get the BBS SIG started in TPRS and help to get the TAPR BBS SIG started after that. Why doesn't TAPR have an BBS e-mail ? Again people started to send orders in by the packet radio system. When this started to happen our only response was to stop being on packet radio. The other problem was that -- someone would send a message in for help, we would send a reply back and then get a letter or hear from them

several months later stating that they were upset because they never heard from us. In some cases we never even got the message. How do you handle that ? All it did was get a lot more people mad us then we probably have not being on at all.

Heck, I would have probably had a BBS on the air in 1986, but there was never a need in the Dallas/Ft Worth area for the longest time. So -- I focused on network building.

TAPR has nothing aginst BBS operations and I think BBS sysops will play an important role as new systems come on-line -- that is if they want to. Charles has always stated that I had something aginst BBS operations. I don't. Life is to short to limit your choices in who you communicate with and try to get active in projects. Being exclusionist only means that you have no members after a while. Many of our members are BBS sysops and than still operate. Charles rages on about how TAPR and myself is out to destroy BBS operations and amateur radio overall by doing nothing but telephone operations. Well, that is just wrong.

Cheers - Greg, WD5IVD

Just about as much assembly as your average TNC. Build a radio cable, and
an interface circuit with a pair of transistors and resistors.
Manufactures warrenty? You may have heard of the little company - it's
called Motorola. Ready to run? Can you load MSYS on your computer?
Well, it's about 10 times easier to download your preferred modem
into the EVM.

>Sounds a lot cheaper than the $175 I've been paying for used KPC-9612s.
>How do they compare to the KPC-9612 at 9600 baud?
>What interface firmware is available? Assume KISS, but is there anything else?
>

KISS is the standard interface used by the EVM modems. Want another interface? You can
program it yourself.
Performance? It blows away my KPC-9612 on both 1200 and 9600, and the 9612
isn't any slouch.

>i.e. tell us why these might be cost-effective.
>It sounds like it has about the same capabilities as presently available
>TNCs, perhaps at a lower price. If that is true I can use a bunch.
>

Call up Arrow for the board, and download the modems from the TAPR
web site. Spend a few dollars on 3904's and some 5-pin DIN connectors.
It's still much cheaper that those 9612's.

>> And why do you say the total cost for all the goodies you name is
>> $100, and then say I have to pay $130 to get the bare board?
>

>list given above, it looked a lot like your basic TNC.
>

That's because I never said it was a kit.

Now where, exactly, are you getting a basic TNC for $130.00 that does
1200, 9600, noise reduction, HF, Pactor, RTTY, BPSK, DTMF decoding, audio
spectral displays, Feldhall, etc? I must have missed hearing about that
manufacturer.

>

Really? Those of us in Western New York who are building up our
high-speed networks would be suprised to hear it. 56K is the next step.
After that, the sky is the limit. See, we don't let the luddites tell
us why we can't do something.

QST, yes. 73 has been in the forefront of many innovations in ham
radio, including packet. I suspect that if somebody wrote up this
board and its applications in a reasonably professional manner, Wayne
would publish it.

>is this thing called "The World Wide Web". You may have heard of it.
>You can find all sorts of things out there.

The Web is nice for looking up all sorts of arcana, but it basically
sucks at getting out the word to the masses that comprise the customer
base that's needed to make any new ham innovation take off.

>For information about the Motorola EVM boards, try:
> http://www.tapr.org/dsp/evm56k/index.html

Thanks. I'll do it. Even this sort of thing is more information than
we usually get from the elitists who want everybody to sweat blood to
learn about the secret treasures.

>More importantly, you are going to have to invest some time to figure out
>how it all works. For me, that is fun.

Yes, it does sound interesting. But why, I ask again, have I had to drag it out of someone by admittedly being a damn pest here, rather than having it available where even the timid couldn't help seeing it? If 1 percent of the energy wasted debating no/code were invested in promoting newer forms of digital comms, we'd be buried in good ideas and information.

>>"Affordablility" is more than just out of pocket cost. Assuming this

>Whine, whine, whine.

It's not me who's doing the whining, it's the folks bitching about how outdated the present network is without providing any _reasonable_ alternatives. But if whining is what it takes to drag the information out of those who have it, then I'll settle for whining.

>Remind me what is your hobby again? Is it sitting around like Ozymandias,

>you upset, pick a different hobby, or at least, rethink your current one.

Exactly. As I've written before, I've done my stint in the trenches, and I don't much enjoy it any more, so I've cut way back on it. Now I enjoy watching people tell me why I wasted my time doing all that when I could have been getting in line to hook up to the Internet. In fact, if getting insulted is enjoyable, a person could get absolutely ecstatic around here.

>brochures cost money, and if it raised the price of your TNC $20 so that
>they could advertise, I bet you'd complain bitterly. The market for these
>devices is not large.

Oh, really? Kantronics and MFJ both advertise heavily in QST.
Pac-Comm, IMO, makes a superior product. If they advertised it, they
could probably sell enough product to more than cover the cost of the
ads. And if not that, then how about mailing a brochure to previous
customers? If they can't even scrape up a stamp, how about putting me
on a damn e-mail list, for petesakes? This stuff ain't rocket
science, fellas. It's Marketing 101. Even a high school kid should
be able to figure that out.

>quite snazzy :)

No argument there. I agree completely. But it doesn't really address
any of the points I've been trying to make.

Now, if I've been reading this stuff correctly, one of these boards
and some (presumably) free software/firmware will get you the
approximate equivalent of a multi-mode TNC, only more, better, and
cheaper, is that correct? Or is there some hidden kicker that keeps
this device from being a better buy than, say, a Kam?

>
>Word of mouth is advertising. Ham gear is cut-throat, there's not enough
>Hams to support advertising in the normal form.

Tell that to Kantronics and MFJ, and hundreds of other little outfits
that advertise neat stuff in 73, QST, Mobile Radio Technology, and
Nuts & Volts, to name just the ones I subscribe to.

> How many Astronomy
>Ads do you see in daily life?

I subscribe to Ham magazines, and I see lots of ads for ham gear, some of it from very small companies or even individuals. My son subscribes to an astronomy magazine, and it's loaded with astronomy related ads.

> How many Radio Telescopes do you see
>advertised?

I haven't checked, but I'd be surprised if there weren't such ads in any magazine devoted to astronomy buffs, or even in general purpose rags like Popular Science.

>Do a Web search on Radio Telescopes and you'd be
>surprised at what's available! How about a .34 dB NF (woo-hoo!)

You might be surprised how many potential customers for anything you can think of don't have net connections, or, if they do have a connection, don't use it for searching out such things.

Some people get so tied up in the glitz of computers that they lose sight of what's going on in the Real World.

>simply no longer interested.

I think you're right. I also think that if the folks who _are_
interested were doing a better job of promoting their technology,
perhaps they could stir up renewed interest. I still remember the
time our club brought in a guy from Salt Lake City to demonstrate this
neat new "Packet Radio" for us. He had a couple of TAPR-2 kits, a
monitor, radios, a projector and some really bad homemade film of
folks doing various packet stuff, lots of literature, and a TON of
ENTHUSIASM! By the time he was done, he'd inspired several people to
buy and build kits, and start setting up a local digi network. Those
same folks installed a NetRom node as soon as it became available.

So one person with enthusiasm was able to start this whole area on the
new (to us) hobby of packet radio. There's nothing like that going
on any more. That's what we need, if amateur packet is going to be
anything more than a niche for a bunch of recluses, much like RTTY has
always been.

Most packet ops appear to have little if any motivation to go on to higher speed stuff.

I used to think it was the expense or difficulty involved, and maybe five years ago that idea would have held water. It sure doesn't now, but I still don't see any widespread interest in high-speed.

For years I had a TAPR 9.6kb modem hung on the back of a DRSI PCPA-1, along with a couple of converted 2-meter rigs set up and ready to go, (My theory being that if a 9.6kb port existed on my node, it would encourage others to get started. The second rig was for a deserving experimenter who never materialized.) but nobody ever tried to utilize that setup. Later I changed over to an AEA PK-96 (neat TNC!) but still no joy on finding anyone else interested in utilizing the 9.6kb port I had made available. I "advertised" by putting blurbs in my BBS beacons and connect text, and by blabbing about it on the local repeater at times.

Now I've gotten to the point where I do not consider 9.6kb to be "high-speed" anymore. I've gotten rid of the 9.6kb stuff, and will not buy anything faster until I know that there will be somebody on the other end to connect with.

For my part, the general indifference about high-speed packet is a mystery. It's easy to come up with some sort of technical rationalization, or just say that everybody's stupid and lazy. I don't go for that. The "answers" I have seen to this question have not been very impressive. Mainly just expressions of frustration, ect.

The kicker is, that you have to insert a floppy into your floppy drive,
and there is no case. The other kicker is, that you have to make a PTT
circuit. I run mine on a piece of pine wood laying over in the corner,
with some tacks nailed in, used for soldering components...

I think the reason you got no interest is pretty obvious. You weren't
providing them with anything that required a high speed connection
to use effectively. A port on a BBS only allows one to read or post
bulletins. Most hams look at that and say, "I can't type faster than
1200 baud, so why should I hassle with adapting 9.6 kb to a radio not
designed for it?"

Now if you had provided them with a *network* of 9.6 kb switches so
that they could use 9.6 kb for more than BBSing, IE let them do the
digital equivalent of slow scan among themselves by swapping JPEGs
for example, you might have gotten more interest. Or if you had provided
them with a service which needed high speed to be usable, such as a
web server or Real Audio server, you might have gotten more interest.

I notice that you didn't work through a LAN organization to establish a high speed network. And that's a critical failure. If you want high speed networks, you have to work with the network providers to develop the high speed network infrastructure before users will come. Users aren't going to go to a lot of trouble just to make a single hop to one other station. That's just not a big enough return on their time and investment. But if you offer them a relatively large and fast network, and something to do with it which requires a bit of speed, then they get interested.

When we first started supplying the 56 kb modems ten years ago, we had to keep reminding people that they needed to get together and make group buys for their area or they'd have no one to connect to with their new toy. A few didn't listen, and their modems gathered dust. To move to a higher speed, you must have a group effort, or it won't be worthwhile. Two is generally not a large enough group.

:

As you mentioned above, the technical aspects for high-speed networking
are simply no longer an issue. It used to be a royal pain to align a
9600bps modem and radio (even if you could get a 9600bps capable radio
in the first place.) Now, you can get a used TEKK for $60.00, and a KPC-9612,
and be up and running in minutes, after turning a trimpot for alignment.
Get a pair of 9612's and cross-calibrate them, and you're up in
literally seconds. A Paccom DSY modem, PI/2 card, and DownEast
transverter can be hooked up and operational as fast as you can crimp
a couple of DB-15 connectors. It really is THAT easy

That being the case, the major problem that I see is lack of applications
for which high speed is useful. Quite frankly, 1200bps on a lightly loaded
channel is reasonably sufficent for the guy who wants to read the
latest 'DEBATE' bulletin, and nothing else. Being able to transport that
message faster isn't going to get him excited.

That being the case, it reduces to a large extent to a simple lack
of imagination about what *CAN* be done at high speeds. As I mentioned
before, once you get into the realm of 56K, you have the possibility
of digital voice, video, and even keyboard chats at essentially
the speed of typing, rather than the speed of a loaded 1200bps link.
Unfortunately, Amateurs seem to have an amazing ability to rationalize
maintaining the
status-quo. For a group whose charter is supposed to include
technological innovation, that's a death sentence.

As Gary had intimated before, one of the primary mechanisms to get
maximum use out of a network is to build it such that the backbone
can provide a data pipe. Once that pipe is in place, you can hang
anything that you like off of it - BBS's, chat servers, web databases,
etc. To get to that point, you need some people who are more interested
in building the pipe, and not necessarily interested in what the pipe
carries. The former issue, I think, tends to appeal to the person
who is interested in the "hardware" aspects, while the latter is
going to be the, for lack of a better term, "appliance" operator. Of course,
nobody wants to build a bridge that never gets used, so you really
have to get the appliance people telling the hardware people that they
have some spiffy new application that just begs for speed.

Ah, in other words, it requires a computer to run it. Well, there
goes the node site potential I was referring to. We're not going to
buy a half dozen computers just to upgrade our node sites. I thought
we were talking about network upgrades and improvements here, not end
user interfaces.

Yes, exactly. That was my point. And I'm fairly curious and
interested in such things. If I don't see this stuff, what chance is
there that the "average" ham is going to see them?

>As you know, TAPR is not just one person or a small group of people. The

That's typical, and it illustrates the problem. The tinkerers and
inventors are seldom interested in promotion, or in putting the stuff
to practical widespread use. So the folks who build and maintain the
networks use off-the-shelf stuff that's not state of the art. Until
the new stuff reaches some sort of critical mass, it's nothing but
toys for the tinkerers.

>and we typically get something to put into the PSR as well. Experimenting

>As to Charles being locked out -- he can't be locked out. He can either use
>TexNet node in Denton, Texas -- which I maintain -- or the TexNet node in

He's locked out of the system where we get our feed. And yes, that
feed is on the Internet, since we don't have a ham link out of the
area.

>Sherman. The TexNet node, since it was written by the group I used to be Pres
>of (TPRS), can't lock anyone out -- doesn't have the code in it to lock out
>anyone. It might be the issue that Charles can't get to the Denton node now,
>due to hardware problems. Why Charles would say he can't get access is beyond
>me.

Charles didn't say anything about it. I was told this by the SysOp
involved. Since then, not one of his bulletins has made it here.

>As to posting things on to the BBS network. Again, does anyone want to do it ?
> We found someone a year or two ago and they did it for about four months until
>they couldn't take all the negative comments about them and their family that
>some people started putting out on the PBBS network, so they stopped. Fine.
>Amateurs doing it to amateurs again.

That's a sad fact of the hobby. If a person puts out information in a
non-confrontational manner, it seldom draws much negative comment.

>Charles rages on about how TAPR and myself is out to destroy BBS operations and
>amateur radio overall by doing nothing but telephone operations. Well, that is
>just wrong.

Perhaps it is. There's certainly a lot of that sentiment out there,
however, and I'm not quite sure why. Right here in this forum, you
see folks calling BBS and NetRom users Luddites and all sorts of other
names almost every day, usually because they question the use of
non-ham comms to the detriment of ham methods. That's hardly the way
to promote change or new amateur digital comms.

>
>If your news reader can't use 132 columns, that is YOUR problem.

I can see you don't hang out on any newsgroups where the real UseNet
experts post.

If you don't know why 132 columns is improper, I'm not about to
educate you. Here's a hint: Next time you open a book, check how
many lines run from one page over onto the next one. Then go look at
the offending message on Deja News. Maybe THEY need a better
newsreader, too, just to handle your peccadillos.

And yes, my newsreader can handle 132 columns. It can handle 1320
columns. Why don't you just go ahead and post everything in one long
line? All those CR/LF characters are just wasted bandwidth, right?

No, it doesn't require a computer to run it. A $11.00 Flash RAM
chip allows you to load the modem into non-volatile RAM. Yes, you
need a computer to load the modem initially. Of course, you've already
demonstrated that you have one. :-)

520. MSYS Monitor Timeout help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-23 00:00:00 UTC
From: "James W. Barr" <jbarr@Venus.mcs.net>
Message-ID: <6aa7gv$4ba$1@Nntp1.mcs.net>
Source record: 25784

I am running MSYS on a Windows 95 box in a DOS window (Pentium 75 w/32Mb RAM). All aspects of the program work just fine except the monitor function (mapped to f2 on the keyboard). After a short while (say, 10 minutes) and sometimes on startup, a message displays in the monitor screen "Monitor Timeout!". The program still accepts connects in and makes connects out and beacons, but nothing gets copied to the monitor window. Occasionally, inbound and outbound messages will appear, but not all. Yes, I do have ALL monitoring set to "ON" and it IS set to monitor "Port 1", my only port.

I figured that maybe it needs "more CPU time" so I changed "Idle sensitivity" to "Low" on the "Misc" tab in the preferences screen for the shortcut and even turned off the screen saver, but that changed nothing. Of course, since MSYS can run effectivly on a 286-class machine, it should perform well on my system.

Any suggestions as to how to eliminate the "Monitor Timeout!" message and get monitor to work?

Thanks & '73

> encourage high-speed user access.

We have the same problem in the "big" city of Oklahoma City as well. There is no real interest in 9600 baud, even though a repeater exists. There was some interest early on, but without the user-base it died off. I think the real problem, was that everyone talked about cheap radios, but when you personally went to go get one, the price turned out to be double. Then all attempts to modify a PLL to do 9600 baud DFSK, turned out to be impossible, then the final killer was when the 9600 ready radios were not. At that point the Ham's just said, no thanks, I'll go do something else. I think all along Tekk was there, but the dream of high power kept most from buying a 2 watt crystal rig.

Now the question is, how do we bring them back?

The answer is not with a BBS that they all left 10 years ago. They will not use that stuff. They might consider you forwarding to their full-blown mailbox that most TNC's are equipped with, maybe even at 9600 baud. Even an Internet Gateway will not bring them back. I've run an Internet gateway off and on for a few years, and I get about 2 or 3 connects a day! That's it, there's no threat to RF with an Internet gateway, I can assure you. Mostly because it is just a big Netrom, and who wants to go netrom hopping anymore?

I think someone finally touched on a real candidate, by talking about the DSP stuff. Here's an excellent chance to experiment with all kinds of modulation schemes and low level protocols to replace AX.25 with a DSP that costs less than a meal for four at a restaurant (instead of the initial stuff that was in the $1k range).

With this, the papers that Phil Karn has done the past few years, makes for some interesting experimenting in FEC and TDM (that is TDM in the sense of a half-duplex channel).

I guess what I'm saying, is that 2 meters and 70cm is a great area for DSP experimentation, and now is better than later, because Spread Spectrum will make half-duplex pretty much an obsolete endeavor 5 years down the road.

I'm of the opinion, that in 5 years there will either be a Ham SS radio, or the commercial rigs will be produced in quantities that anyone (even non-Hams) will purchase them as they purchase 33k modems now.

I know TAPR is working on an SS radio, but TAPR has pretty long time lines.

Steve

NASA'S ACE MISSION READY TO START NEXT MONTH
posted on 1/23/98 at 17:13 UTC by Keith Stein

NASA's Advanced Composition Explorer (ACE) has been in orbit for about 150 days now, and everything looks very good onboard the spacecraft, according to NASA's Goddard Space Flight Center, Greenbelt, Md.

The instruments have all completed their high voltage ramp ups, with "some minor glitches", but working well.

The "official" start of the mission is set for February 1, 1998.

On January 21, 1998, the National Oceanic and Atmospheric Administration (NOAA) and the ACE project opened up the ACE Real Time Solar Wind monitoring capability to the public.

The intent is to provide 24 coverage of the solar wind parameters and solar energetic particle intensity.

ACE may provide as much as an hour's warning of major solar events that can cause geomagnetic storms here on earth, according to scientists working within the project.

ACE was launched on August 25, 1997 aboard a Delta 2 rocket from Cape Canaveral Air Station, Fla.

I found the following in the documentation. Thanks for those who helpped
me with this!

>>>
F2time number
The number of seconds to continue displaying monitored packets
after F2 (function key) was last pressed. The default is 600
seconds (10 minutes). Thus 10 minutes after you last press F2
monitoring will be turned off until you press F2 again. If you
set F2 to 0 this function will be turned off. There is a fair
amount of overhead in formatting all the information displayed
on the F2 screen so on slower systems it is a good idea to allow
the display to be suspended when you aren't actively looking at
it!
<<<

WinRTTY or Writertty 8.0 supports RTTY via a sound card and a CW
keyboard using an external interface to rig. There's a link to it on my
webpage, http://www.sky.net/~crucis/linklist.htm
Look in amateur radio section for "Writelog for Windows."

RITTY is by Brian Beezely, K6STI. He uses N1RCT's webpage as a
distributing point. It uses a 16-bit sound blaster soundcard to decode
RTTY and Pactor II and will print with the sig doesn't even wiggle the S
meter. The current version is 2.24. You can download a demo version
and try it out.

It's a DOS application but works just fine in a Win95 DOS window. Be
sure to set all memory properties to "auto."

Well, we should have a 2.4G 2Mbps radio with Ethernet interface available
around or a little after Dayton. Still working on the details with the mfg to
get the radio moved into the amateur radio band, since Part 15 2.4G overlaps
our band, ulike 900Mhz which is a direct one to one overlay.

It should cost less than $500 and be an assembled radio OEM module with a
simple interface digital kit.

Don't quote me. Until we are making the thing available it is all vapor ware,
but it does look very good.

Cheers - Greg

> Problems only get solved when someone steps up to do something about them.

... and when there is some interest in getting the problem solved.

For example: I've volunteered, many times, to provide an HF link
to/from the Texas BBS network so that Ham Radio could be used
instead of the internet. Been turned down every time.

Another example: would really like to see some organization undertake
the establishment and promulgation of standards for packet networking.
Some issues that need to be addressed include bulletin designators,
establishment of a viable user and resource database, optimal use of
long haul links for message routing, etc. Have asked the ARRL and TAPR
to please step up to this. Others have asked other organizations. Net
result has pretty much been zilch, other than a couple minor attempts
(ARRL with the BBS forwarding standard, TAPR with the designator
standard) which have had no follow through.

Another example: the BBS network and protocols have mostly reached
the end of their usefulness. To migrate to other protocols, the applications
which use these new protocols must be backward compatible with the
existing protocols. I posted a number of suggestions on ways this might
be accomplished to this and other fora. Net response has been nil.

My conclusion: packet radio reached it's maximum potential about 4-5
years ago and has since been in decline, at least in this country.

Will TAPR do something about any of these issues?

Where's the beef here? TAPR is a membership organization open to any amateur.
And any member can run for office. It is not a terribly large organization with an
entrenched bureaucracy, unlike ARRL, so it wouldn't take a large number of votes
to be elected to office. If you don't like the way TAPR is run, and can convince
enough other TAPR members of your point of view, you can simply run for office

and change the way it operates.

IMHO, the current BOD and officers have the support of the membership.
They don't always do things exactly the way I would, but they certainly aren't going so far astray that I'm moved to run against any of them. If you are, then do so and let the democratic process determine whether your point of view is the one the membership desires or not.

TAPR is chartered as a non-profit R&D and educational operation. Its purposes are to foster experimentation and education in the field of packet switched amateur radio. That experimentation and development is done on a voluntary basis by members pursuing goals which interest *them*. TAPR's job is to aid those members to do such experimentation and development by providing a forum for exchanging information, arranging group buys of system components, and in some exceptional cases by providing funding or making kits available. It is not intended to be a commercial enterprise catering to a consumer market. It is not competing for market share, nor is it trying to shape consumer purchasing decisions by advertising. Those are the province of commerical companies. If TAPR were to head in that direction, it would lose its tax exempt status.

Where have you been? TAPR told us about this in PSR, has info about
it on their webpage, maintains a user group SIG, and has had it mentioned
in the digital columns of a number of amateur magazines, as well as in
DCC proceedings. TAPR is not a commercial enterprise, and it would
be inappropriate for TAPR to try to shape consumer buying habits via
advertising a Motorola product which they offered to members at a group
discount.

>And why do you say the total cost for all the goodies you name is
>$100, and then say I have to pay $130 to get the bare board?

TAPR made a group buy of the Motorola EVMs at a discounted price.
$130 is the regular distributor cost of this board from Motorola distributors.
It is not a bare board. It is a fully built and tested assembly. Analog Devices
offers a similar product for $99. That's what I use for my HF I/Q radio.

>> Explain to me again how new technology is unaffordable, and TAPR

>tons of kits. It takes enough time just to interface, install, and
>test it all, without having to build it, too.

What *are* you talking about? The EVM is a DSP module one can
use to implement a DSP modem. It also has enough processing
power to act as a PAD and have a KISS interface to a computer,
IE totally replace the functionality of a TNC. TAPR's DSP SIG has
facilitated a development community to form around this board
which has resulted in a number of software modems being written
for it. It can now take the place of any sort of multimode controller
commonly sold to amateurs by commercial companies while costing
much less and offering a platform for further signal design and protocol
development to the individual amateur. This is a great thing (though I
like the Analog Devices EVM better).

If you're expecting TAPR members to come out and install a network
for you, dream on. TAPR isn't in the common carrier business, contract
with MCI, Sprint, or AT&T if you want a turnkey network.

>Of course, unless your device is completely backwards compatible with
>existing stuff, you have the added headache of getting all the users
>to build it, too, or find a way to interface the old net with the new
>one, with all the redundancy that requires.

Motorola builds it, the user loads software on it and runs it. TAPR SIG members have written software for it that implements a number of modems, including the archaic Bell 202 standard. That's the beauty of DSP, you can implement in software practically anything you want, and change it in moments by uploading different software to it.

>Until and unless this stuff is available commercially, and widely
>advertised, it's just Pie In The Sky, for all practical purposes.

>brochure occasionally. If I want to buy some new trinket they build,
>and assuming I somehow even hear about it, I have to find their phone
>number, call them up, and get them to send me a price sheet.

Oh, poor baby! PacComm is a small company run by an amateur who wants to offer things of interest to digitally inclined amateurs as a sideline to his main corporate and government markets. To do that in a cost effective manner, he cannot afford a large advertising budget. Perhaps Kantronics can, but AEA managed to find bankrupcty trying to be a big consumer equipment company with splashy ads and glossy brochures.

PacComm doesn't aim at a large consumer market, because one doesn't exist in the small amateur radio digital community. It is a low overhead operation which works largely by word of mouth to supply digital amateurs with things like the GRAPES 56 kb RF modem or the PTC-II at an affordable price. At one time, its Tiny 2 and the like were cutting edge, they aren't anymore. PacComm still carries them, but the main emphasis that Gwyn has placed on this part of his business is to make newer technologies available to advanced amateur experimenters.

(Though from time to time PacComm has placed some ads where they would be most effective. PacComm advertised in QEX and in a number of digital amateur newsletters. That gives low cost access to a precisely targeted market for PacComm's advanced equipment offerings. And Gwyn is at most of the major hamfests showing off his products and getting input from his customers. I'm reliably informed that he has more business than he can handle, so I expect he's doing something right *for him* and his company.)

>(Hmmm, maybe they've got a Web Page. I'll have to go looking for it,
>but I've never seen a link to them from any ham sites, so I'd guess
>they don't have a site.)

Of course you could have just tried the obvious, www.paccomm.com. And by golly there it is. If you haven't seen a link to it on other sites, then you probably haven't been looking at sites catering to digital amateur radio interests. There is certainly a link on Ham Radio Online's site, and on many of the sites dedicated to digital amateur radio.

>Now, no doubt, Gary, a professional in the electronics field, will

>relaxation, and education, not to support networks. There may be
>exceptions in small areas, but they _are_ exceptions, IMO.

Hey, you can have a good network if you want it. If you don't want to
put out the effort it requires, of course, you never will. That has nothing
to do with being a professional in the electronics field. What I do for a
living has very little at all to do with digital radio (though that is changing
with the advent of DTV). Nor are the majority of GRAPES members
employed in the wireless networking field. But we're interested in
the technology and made efforts to learn about it and do something
with it. For most of us, that's why we're radio amateurs, so we can
play with new technologies outside the confines of our work experience.

>would publish it.

But will the check clear? From what I hear, most of 73's authors have quit submitting material because bankrupt Uncle Wayne isn't paying his bills. For the most part, people working with this technology are not professional writers. They post on the SIG, they have webpages, they talk about what they're doing on the radio, at club meetings, and at hamfests, but they aren't going to sit down and spend a couple of weeks crafting a magazine article for a general interest magazine. That isn't their idea of fun (nor is it mine, which is why I don't do it).

Some do write things, but they submit them to places where their peers will comprehend them without having to resort to baby talk, like QEX, PSR, or DCC proceedings. (Note, that's not arrogance, that's just the way it is. People working in these areas don't want to waste their time constantly going back to square one. There are introductory books for that.) Digital amateur radio isn't a commerical enterprise. It isn't marketing to shape the consumer behavior of the masses. You must have an interest to become involved. And that's the way it should be.

If you'd read *any* of these resources, you'd have heard about most of the things about which you are complaining that you're being kept in the dark. The information is out there in the appropriate places, one of the most appropriate being the TAPR website. And the digital columnists in the mainstream magazines *constantly* point you to these resources. It is up to you to take advantage of them.

One of the problems with digital amateur radio, and amateur radio in general today, is that too many amateurs expect to be spoon fed and consumer brainwashed by flashy advertising and baby talk expositions instead of taking an active role and pursuing their amateur radio interests under their own steam. Amateur radio is a voluntary activity, and you have to act, not be a sheep with a smoking credit card swayed by advertising hype. Half the fun is in exploring and discovering what's available and what you can do with it, then sweating bullets learning how to make it

work. It is those Ah Ha! moments when it all comes together which is why it is worth being a radio amateur. Having everything spoon fed to you is boring.

A clone PC is the most cost effective switch we can have at a network site. And the most maintainable. The latter is essential for a network which must stay up. Having spares as near as the corner clone store is a huge advantage and cost savings to the network maintainers because it reduces the amount of special single vendor hardware that must be kept in inventory. That's why the TAPR NNC and Kantronic's Data Engine never took off.

A switch must always be a computer, whether it is a PC or an embedded Z80. But the embedded Z80 doesn't have the horsepower to handle a modern network's requirements. A $200 PC clone based switch does. Note that you don't need monitor, keyboard, or anything else at the site, just the motherboard, case/PS, floppy drive, and digital interface card(s). And the motherboard doesn't have to be top of the line, a 386SX does fine at 56 kb, or switching up to 5 9.6 kb streams.

Nope. By the time the average guy adopts it, it's old hat. You don't know much about how technological change happens do you, Glenn? Anything that's made it to the mass market is already obsolete. A development community like the one TAPR supports has already moved on to the next level. Mass marketers always trail technological change, they don't drive it. That's because there's no profit until you're on the back side of the learning curve.

I'm familiar with non-realtime batching. It is a way to avoid having to upgrade
network speed because user interaction all takes place on their local machine
while transfers occur in the background in non-realtime. So rather than promoting
faster net access, batching tends to reduce the need for it. That's very old, uucp
1200 baud dialups did it decades ago. It's mostly gone now on faster networks.
Callsign servers and grid square calculators and the like don't generate much

user input or output, and are generally limited to how fast the user can type in the queries, so they aren't demanding of network speed either. File transfers are network hogs, but that's mostly transparent to the user since they can go on in the background while he's doing something else. So they don't have him sitting glassy eyed in front of the screen waiting for them to complete (at least they don't if he isn't stuck with an old fashioned single tasking system). Games now, that can put a real premium on network interaction speed. But I haven't seen much in the way of interactive gaming on the BBSs (and I do still watch the BBS activity, which is a very small fraction of network traffic here).

>In any case, my "BBS ports" are also "network resources", in that my BBS is

Ok, good, so you have an extensive 9.6 kb or faster network that the user can access from your node. How many hops can they go? And how many others are directly on the network with which they can connect and interact in realtime at high enough speeds for interactive applications?

One application I've found to be popular on faster networks is exchanging drawings and pictures. When you're chatting with someone and trying to describe a circuit, or a new antenna, it is very handy to be able to send a drawing or picture in a few seconds that you both can now use to talk about. If it takes 45 minutes to transfer, though, people won't do it. By then the thread of the conversation is lost.

>>I notice that you didn't work through a LAN organization to establish
>>a high speed network. And that's a critical failure. If you want high
>>speed networks, you have to work with the network providers to develop
>>the high speed network infrastructure before users will come. Users
>>aren't going to go to a lot of trouble just to make a single hop to one

>>investment. But if you offer them a relatively large and fast network,
>>and something to do with it which requires a bit of speed, then they
>>get interested.
>
>See the above. You assume an awful lot, OM.

I can only go by what you say. You said you posted bulletins to your BBS and beaconed. You did not say that you talked it up at LAN meetings or surveyed the interest of LAN members. You did not say that you demonstrated it at meetings and got the LAN to accept it as a supported service. Getting the active local community behind it is essential to having it well used.

Actually, I'm not surprised that you couldn't get much interest in 9.6 kb. We never have here either. It's a pain in the butt to get to work through ordinary voice radios, and it isn't enough faster than 1200 baud for most of the things users do to generate any "Oh, wow!" reaction among them. Show them 56 kb though, and the jaws drop. They begin to see whole

new classes of applications they can do. And that generates interest
and excitement.

>>When we first started supplying the 56 kb modems ten years ago,

>
>It would be a start though, wouldn't it? Again, though, I was not trying to
>"build a new network".

Two isn't a critical mass. Very few links with only one user on each end
last very long. Usually people won't make an investment unless they have
more connectivity than that. Oh it does happen, but not very often. Activity
seems to stick when the number of users reaches about 10 or so. Then
there's enough different interactions possible to sustain interest.

I don't think 9.6 kb is ever going to amount to anything. It's too much of a pain
to make it work through our voice radios, and it doesn't offer enough real
speed gain to bring in whole new classes of applications. It takes a bigger
jump to get people excited. 56 kb does it. Then you can start exchanging
drawings and pictures quickly and easily, which is a big boost when you're
trying to explain that new circuit or show off that new antenna you built.
And you can put up your own webpage, run digital audio, etc. That gets
people excited.

I don't think 2m and 70cm are the places where DSP shines, except for
satellite work and EME. HF is the place where DSP can really strut its stuff.
The mild gaussian noise environment of VHF+ just doesn't need what DSP
has to offer.

I hope something interesting happens with SS, but I'm not as convinced
as you are that it will take off. At uppper UHF, and with amateur restrictions,
it just doesn't offer us much that we can't get with more conventional
methods at a lower cost. Perhaps it will bring in a whole new class of
applications, but I don't see them at the moment. As a technology
exercise, it is potentially interesting if we can do more than just duplicate
Part 15 devices, but ultimately we need a reason to use it, and I don't
see much of one that can't be served better by lower cost wideband
FSK. Perhaps its multipath resistance will generate a demand for
mobile digital operation.

Well, that makes sense to me. I always figured that would be the best
way to go about it. But how do you keep the dust, bugs, etc, out of
it? Can you run it without a fan drawing dirt into it all the time?
Even at home, it's hard to keep the dust from building up inside the
machine.

You can make an excellent 9.6k rig from an old GE, RCA, or Motorola
radio for under $100. We have a bunch of them on our backbone. Many
multi-mode 2 meter radios will go on 9600 with a trivial modification.

>speed gain to bring in whole new classes of applications. It takes a bigger
>jump to get people excited. 56 kb does it. Then you can start exchanging

Yeah, but you if it's difficult to get a radio on 9.6, how are you
going to get on 56kb? That takes even more hassle and expense.

>drawings and pictures quickly and easily, which is a big boost when you're

I can get drawings and pictures at 1200, if I'm willing to do it other
than "live." And it's gotta be DAMN fast to keep me interested
"live." Even the Internet is too slow for anything more than fairly
small graphics. I prefer to let the computer do the waiting around,
while I do something more productive. I don't even do IRC chat until
late at night, and even then I'm usually doing something else at the
same time.

>trying to explain that new circuit or show off that new antenna you built.
>And you can put up your own webpage, run digital audio, etc. That gets

Temporarily, no doubt. Will it keep them supporting a network over a
long period of time, even if you get them interested in the first
place? Remember, most of the country is fairly rural, at least west
of the Plains States, and getting a critical mass of hams together is
not easy.

Source record: 25812

The site I posted before for soundblaster digital modes didn't turn out to have as much as first thought (I misunderstood the info. that came up on my search engine for the site). Here are two better sites, especially the first:

http://www.muenster.de/~welp/sb.htm

http://www.ej1bbs.demon.nl/eng/software.html

I'm still seeking a report from someone of a real good Packet application and a real good HF Pactor application. They need to be equal in performance on these two modes to the KAM Plus v.8 (two separate programs are acceptable, but must coexist and run concurrently), somewhat less expensive (KAM Plus v.8 dual VHF & HF, $225.-$275. is used.), and run under Windows so as to not capture the PC.

Thanks for sharing your experiences!

Maybe, but has dirt ever caused it to crash? PCs are amazingly
tolerant of bad environmental conditions. We've been running PC
switches on unconditioned mountaintops for 10 years now. The
only problems we've had have been with floppy *disks*, not the
drive, the disks. And that's because temperature extremes have
caused them to shed oxide. Temperatures in the racks can exceed
120 F in summer. We started using cheap small hard drives to get
around that problem.

The fans quit in some of them years ago. We haven't bothered to
replace them. We aren't overclocking, so nothing runs hot enough
to need a fan anyway. We did make extensive use of fine wire
mesh to seal RFI into the computers and out of the radios on the

sites. That has the side effect of keeping insects out of the PCs.

Now if we were using overclocked Pentiums and had a bunch
of power hungry accessory boards, the situation might be different.
But we're running lazy little 386SX machines with nothing in them
but 4 megs of RAM and some PI cards.

PcPackratt must have bugs then. Both programs are terminal programs and there is no reason for one to perform better than the other in regard to received errors. Any difference in errors "should be" a function of the TNC.

>FSK. Perhaps its multipath resistance will generate a demand for
>mobile digital operation.

For fixed point to point contacts, the problem with simple wideband
FSK is that you require a very high quality RF path (preferably line
of sight with no obstacles in the first Fresnel zone in any weather
conditions), so this will seriously limit your service area.

Simple wideband FSK might be usable if one (or both) stations are
mobile, if FEC with long interleaving is used. One station has to be
truly mobile, since for some reason, there is always a multipath null
at traffic lights :-). At frequencies below 1 GHz, the interleaving
would have to be quite long, resulting in long latency times.

So I think simple wideband FSK is only usable in ideal conditions (and
in general it would be too costly for amateurs to make the conditions
ideal), so it is better to look at low symbol rate modulation methods
(such as OFDM which is used in DAB) or spread spectrum.

556. Looking for a specific packetcluster program

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-24 00:00:00 UTC
From: darutter@softcom.net
Message-ID: <34ca2a59.2228966@news.softcom.net>
Source record: 25820

Another ham and I are trying to locate a specific packetcluster program that was being circulated in the early to mid 90s. Neither of us can recall the name of the program but it was specifically designed for packetcluster work and the big feature of it was to plot the callsign of the station on a world map when the spot was received.

As I recall, the program was DOS based although it could have been Windows 3.x.

Does anyone have an idea as to what the program was and where I can find a copy of it.

Thanks in advance and 73

We're still using a highly modified version of JNOS for the switch code.
We keep talking about porting over to Linux, but the present stuff works
so there hasn't been any real effort toward changing over. It would be a
pain because the switches are more than just TCP/IP routers. They also
do a custom table driven form of routing for our plain AX25 users and
that would have to be kludged into Linux. More trouble than it's worth.

The only reasons we have extra memory in the switches are that we
had some surplus SIMMs, and we run PC Anywhere in high memory
on some of the switches for remote dial up administration. We could
do away with that if we used Linux, but since it is up and working, there's
been no urgency to change it.

AFAIK it does not. PACTOR I was added, but not PACTOR II.
A fast Pentium should be able to do it, but Brian hasn't programmed
it as far as I know. I think he'd need a license from SCS.

If he can't even afford to send an occasional bulk mail flier to
previous customers who bought thousands of dollars worth of his
products when his company was just starting out, then he's not much of
a businessman. Even *I* know that much about marketing.

>(Though from time to time PacComm has placed some ads where
>they would be most effective. PacComm advertised in QEX and in
>a number of digital amateur newsletters. That gives low cost access

In other words, it's more of a hobby than a business.

>Hey, you can have a good network if you want it. If you don't want to

Yeah, I can fly to the moon if I want it, too. Get real, will you?
Some things you can do with enough dedication, some you can't. I've
already been involved in building a good network. Of course, you
wouldn't think it was any good, because we can't run FSTV and stereo
audio over it. I've lost track of how many people I've tried to
motivate into putting up an HF link to connect us to the rest of the
world, but the only people the least bit interested are techs, and of
course don't have HF privileges. I guess the code requirements
keeping those lids off the HF bands is a Good Thing, right?

>put out the effort it requires, of course, you never will. That has nothing

I already have. Just because I don't repeatedly blow my own horn here
doesn't mean I've never done anything but sit around and bitch.

There is no question, that incentive licensing has mortally wounded
Amateur Radio. There's still a lot of people calling for a medic, but
HQ is oblivious. Most of the HQ leadership is too timid to work for
a change. There have been some great suggestions over the years,
and all of them deal with the abolishment of the class system. The
hobby is on its last legs, and HQ is fighting over who gets the
cutest license letters. I could care less about my callsign letters,
about as much as my cars VIN number.

My second act as President, would be the simplification of the
Amateur rules. It will state basically, that you will be restricted
from using HF until you reach 5 WPM Morse code.

As you recall, my first act would be to restrict all transmissions to
100 ms or less. The one thing that is sucking the blood out
of the mortally wounded patient, is the channelization of HF.

These "nets", broadcasters, and band planners are the enemy.

Steve

That guy in California, n6gn (???) alleviates that problem with small repeater-like devices. I say repeater like because they are same frequency boosters. He says they are cheap to build on his homepage and can improve a channel back to its freespace equivalent if used properly.

I rather like the idea for the static portion of the network to use wb-fsk or at least non-SS modes. I still have this lingering fear that SS is never gonna be cheap (for hams), and that there are too many hoops to jump through for our friends at the FCC (which is part of the cost problem). Hosing the wb-fsk way is sure fire, well understood by most HAMS, and is can be built from readily available chips that don't require Surface Mount technology. SMT has thrown a curve into our hobby, because some of us like our vision and therefore do not solder SMT :-)

SS still seems the better choice for mobile, though, I have to agree. The SS cell phones have definitely proven to use a successful modulation method for mobile use. I just do not feel progressing down a road of SS only is the best way to take things, as it would eliminate alot of experimentation by HAMS, and kits would be only as difficult as snapping something into a box and hooking up the cables, and not alot would be learned, nor alot saved by a manufacturer who builds the kits, except FCC approval would not be necessary.

My take,

David

From: David Carter <dcarter@tundra.winternet.com>
Message-ID: <6ajj9oprt1@blackice.winternet.com>
Source record: 25739

I'm considering building a pair of N6GN microwave links, as described at http://www.rollanet.org/~joeh/10ghz/n6gn_article.html, and I was wondering if anyone in Minnesota has tried this, or anything like it. Also, I'm curious to know if anyone anywhere has made this work at the full 10Mbps speed, as hypothesized at http://www.tapr.org/~n6gn/uwavelink/faster.html. I am planning on using the 24Ghz gunnplexor modules from SHF microwave, so I believe I should be able to get acceptable throughput. Also, if anyone knows of any sources that still have PCBs for this project, let me know.

Thanks,
David N0RTY

Right.

It's easy to SAY "I wish I could set up that HF link", especially if you
have a no-code axe to grind.

Persons who REALLY want to operate on HF will get off their cans and learn a
little code. If they are too unmotivated or stupid to handle that, we are
much better off without them on HF.

I have set up W0RLI's stealth digi as a two port device. Since then I have tried to add a third port. I did read that one can use "shared" IRQ ports (as in IRQ 4 and 3 for COM1,COM2, COM3 and COM4)
Can anyone enlighten me as to how this will work (or not work very well). In setting the stealth digi, the digi program refuses to recognize any data "from this third" port, but it will send KISS data to this port and cause the third radio to transmit.

I have poured over the docs again, and see where its mentioned to use other IRQ's. Hmm. I looked at the IRQ's that are in use with MSD.COM and dont know how a person would go about doing this. Seems that they are for the most part "owned" by some device, and are not availible (or so I think).
BTW I set this up on a 386SX25 pc, with mono graphics, and MFM HD/3.5 floppy. Just a small system (I can leave out the HD if needed.)
Leave out the REMOVE this from the email to reply directly.

You can't use shared IRQs with normal PC COM port cards.

>I have poured over the docs again, and see where its mentioned to use
>other IRQ's. Hmm. I looked at the IRQ's that are in use with MSD.COM
>and dont know how a person would go about doing this. Seems that they
>are for the most part "owned" by some device, and are not availible
>(or so I think).

A common solution is to use IRQ2/9 (2 and 9 are really the same thing).
IRQ5, which is conventionally used by LPT2, is often available if you
haven't got two printers. (If you don't have a printer at all, you can
use IRQ7.) If you use either 5 or 7, make sure that your LPT ports
aren't jumpered to use the IRQ.

Once you've decided which other IRQ, besides 3 and 4, you can use, many
COM port cards will allow you to select it with a jumper, but some only
allow selection of IRQ3 or 4. If you have one of these, the only way you
can select any other IRQ is by cutting the tracks to IRQ3 or 4 on the
edge connector and linking across to the track for the IRQ you want to
use. You obviously need to be careful when doing this!

An alternative to all this is to use BPQ in multi-drop mode by putting
BPQKISS EPROMs in your TNCs (only works with TNC2 compatibles). That way
you can put more than one TNC on a COM port. It works very well - see
the BPQ KISSROMS.DOC file for more imformation.

A DTV to NTSC converter will be about $100, and will do letterbox too.

> ...but there won't be much HDTV programming to watch in the early years
> of the changeover because there's no existing inventory of HDTV material
> to fill the hours. HDTV receivers will be the province of the videophile
> and the first adopter (and the rabid sports fan). And they are free with
> their money.

The broadcasters will just simulcast the regular stuff at first. The
DTV
receiver will automatically crop the sides. Also, The TV industry has
been
filming shows in Panavision for a while, in preparation for wide format
broadcasting.

IMHO, I think more people will buy DTV for watching movies than sports.

> It is worth noting, however, that Panasonic showed a large screen HDTV

Hello Y'all,

The subject says it all - Where can I find software to act as a gateway between the internet and AX.25? Preferably, it would run under win95 and allow a user to have a PPP connection on a laptop which tunneled the packets through AX.25 to a svr which was connected to the internet.

Thanks, any help would be appreciated!

Fred,

I've been thinking of setting up a packet repeater here in St. Louis, running at either 900 MHz because of its omnidirectional characteristic. I could probably use 900 MHz PCS RF/IF/AF sections. It would probably do 128 Kbps, but I wonder what modulation scheme to use. I'm unfamilar with 802.11 -- what is it? I'd really like to do TCP/IP too, so I can easily link it with the net. Perhaps there's an easier way. Any ideas?

Have a great day!

Dear All,
What are the most likely chip types for cache ram on a 486 motherboard?.
The board manual just says 8k * 8, 32k * 8 and 64k * 8. These are all
narrow dil sockets, same as a 7400 but longer.

So, what are likely device types?.

Regards

Robin

The Ottawa guys were speed doubling the WA4DSY 56 kb RF modem
a few years back. That's MSK, and a Down East Microwave or SSB
Electronics transverter will put it on 902 MHz.

You could build your own direct on channel MSK system from
cordless phone parts I suppose. Or more simply, just a wideband
FSK system. There's plenty of empty bandwidth up there.

You need a link level protocol to carry the network level TCP/IP
packets. AX25 UI frames work about as well as anything. No need
to reinvent the wheel here unless you just want to do it. And it
solves the Part 97 ID requirement for you.

Mike,

I think you were connected in Pactor I, not Pactor II. The SCS box connects in Pactor I and only switches to Pactor II when the other end has that capability. I checked out the N1RCT page and found reference only to Pactor (which is Pactor I). As far as I know Pactor II is currently implemented only in SCS and PacComm PTC-II boxes.

596. Really tough 1dB compression question!?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-29 00:00:00 UTC
From: electron78@aol.com
Message-ID: <19980129023100.VAA18897@ladder03.news.aol.com>
Source record: 25753

If someone could please answer this question (please follow me - this is tough question to explain!): I have an AGC amplifier with a 1dB OUTPUT compression point of +10dBm and a gain of 20dB. The maximum allowed INPUT signal to sustain the AGC amplifier at 1dB compression would then be approximately minus 10dBm (with no AGC). Is it "okay" to inject a signal at the INPUT of the amplifier at +10dBm if I decreases the gain of the AGC amplifier by 20dB (which would still maintain the +10dBm 1dB OUTPUT compression)? Would this still maintain the same distortion levels, or would distortion at the INPUT increase severely, (which would, of course, go into the output)?
In other words, when an OUTPUT 1dB compression point spec is given for an AGC amplifier, can the INPUT signal be increased as the amplifier's gain is lowered if I keep the output at the published 1dB compression point - or do IMDs and harmonics start to increase? I know this is a tough one&#65533;

Thanks!

Mike

597. ??Connect 736R to ST-1??

Newsgroup: rec.radio.amateur.digital.misc

Source record: 25754

Have a ST-1 and need help on how to connect it to the 736R. ST-1 connector is as follows:
Pin 1 Ground
Pin 2 Ground
Pin 3 RTS
Pin 4 RXD
Pin 5 TXD
Don't have a 736R - what pins do the ST-1 connect on the 736R. Have two DIN connectors.

One connector is 6-pin CAT and the other is a 5-pin STBY. Assume the ST-1 connects to the CAT. Best as I can tell the pin-out on the CAT is as follows:
Pin 1 Ground
Pin 2 ????
Pin 3 ????
Pin 4 ????
Pin 5 No Connection
Pin 6 13.8 volts

Please advise connection from ST-1 to 6-pin CAT

If the overall gain of the amplifier is controlled by an attenuator or
potentiometer on the input terminals, then +10 could be applied to
the
input and the control, could be adjusted to provide the same +10 1db
compressed output with the same distortion figure...If the gain is
controlled by changing the electronic parameters of the amplifier,
then
there would be a drastic increase in distortion products...I would
have to question the logic of placing a +10 signal to the input and
adjusting
the gain to +10 output which will be compressed (distorted) 1db...An
amplifier with the same input and output levels are called unity gain
or
isolation amplifiers...Operating such amplifiers at levels that
produce
distortion, is not recommended...

600. MFJ-1278B memory chip??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-29 00:00:00 UTC
From: "Anthony C. Cash" <tonycash@worldnet.att.net>
Message-ID: <6ap64t$h7j@bgtnsc03.worldnet.att.net>
Source record: 25757

Anybody out there know what the chip # is to upgrade the MFJ-1278B
mailbox to 512K. I would think that it could be bought much cheaper that
the $60.00 price tag for the MFJ part# 45C.
Is there any jumpers that need to be changed when installing the chip?
Thanks in Advance
73 de Tony, KD4K
Cumming, GA.

601. N6GN Microwave PC Boards

David,

Unless I was mistaken I saw the PC boards at last week's Wheaton hamfest
here in Chicago. The boards should be available from FAR Circuits (Dundee,
IL) - the baords were listed in the latest catalog.

602. Packet wormholes via internet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-29 00:00:00 UTC
From: rhoops@getonNOSPAMthe.net
Message-ID: <34d0273d.2731455@news.getonthe.net>
Source record: 25759

My name is Randy, K0CM, and I ran a packet BBS from 1987 until 1992. I spent quite a bit of time building a TheNet node network and forwarding mail between BBS's in a 4 state area. Eventually I got tired of it all and shut down the BBS. The nodes mostly went to seed and stopped working.

Now I'm thinking about starting up some packet activity again, but am sorely out of touch. It's pretty hard to get excited about 1200 bps packet when we have high speed internet.

5 years ago I would have been real excited to have what I have now... a full time internet connection via ISDN and a block of IP numbers on the LAN.

It would be real easy to connect up a computer on our LAN (and thus the internet) to some packet gear.

What I'm thinking about is the old BPQ switch, or some version of NOS, but with an internet connection to a similar distant node.

Does anyone have the code or drivers it would take to connect a packet switch to a winsock driver? Are there other nodes connected this way? I remember just as I was giving up packet that several folks were making packet "wormholes" connecting nodes in distant cities via landline links.

With Windows NT and "internet tunneling protocol" it would be easy to create a virtual private network with distant packet nodes. Who is doing this?

Randy K0CM - Springfield, MO

Hallo
I have access to a Tiny-2 TNC from Paccomm. Unfortunately I have no information or manuals for it. I see on the board itself that it has a TCM3105 chip built in. Can this TNC work on its own without a modem? I have only used a simple Baycom modem before so any help would be appreciated.

The Tiny-2 is essentially a TNC-2 clone with a different modem section and a few other tweaks. It's software compatible with the TNC-2.

It's a complete unit that requires no additional modem for 1200 baud use. If you want to operate at a different speed, though, you'd need to use an additional modem -- it has the standard TNC2 modem disconnect header to interface one.

605. Re: Packet wormholes via internet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-29 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <6apuij$ocm@snews1.newsguy.com>
Source record: 25762

I'm running a link with KC5NYH in Arkansas, and he's connected to quite a few others. You might telnet to kc5nyh.ampr.org, or my station is:

n5owk.usa-site.net

and you can connect to him via "C ARK NAGATE".

I run a 64k ISDN myself, with 6 dialups through a Cisco (two modems open if you're in the OKC dialing area :-). Windows and DOS are acceptable for a node, and DOS is pretty much the vehicle for higher speed packet (56k, etc). Although the drivers exist for Linux, I haven't heard if anyone really uses Linux at 56k. The other option is PacComm makes a TNC that will drive the 56k modem with enough horsepower, and then you can feed it from NOS or whatever through BPQ, etc. I'm waiting for Spread Spectrum prices to come down, as 56 k half-duplex at the price it runs is over my justification level. I'd rather run double that at full-duplex for that kind of money.

My Web server is basically idle most of the time, so I added JNOS as a process, and it works very nice. The box is running Linux RedHat 4.2 and basically the JNOS uses a pty (pseudo-tty) to slip to its given IP address.

I ran TNOS for awhile, but compared to JNOS, it is a debugging nightmare. Most of it is broken through constant development, and nothing is documented. JNOS on the other hand, is fully documented, and the code works where you expect it to. For example, the TNOS multiport KISS logic is broken (logs packet counts to all ports), and the mailbox forwarding is defective. The part I needed was completely broken, that of IP Access. So the bottom line is, JNOS on Linux, or the AX.25 Kernel code which does Linux, and has drivers for the PI and the Gracillis DMA cards. Or some old DOS or Windows junker. I ran a DOS box with 1 Meg RAM for years, and that with a Gracilis card was pretty neat for 9600. Then you just threw in an Ethernet card and ran it to the Hub.

There are those who proclaim you can run Linux in 8 Meg or less, but they can only be assumed to dislike any kind of speed, or use a vt100 screen mode. 8 Meg is my minimum for vt100 screen mode, and 16 Meg the minimum for X windows on Linux. Memory is so cheap, I usually throw 64 Meg into everything.

Basically, the setup for JNOS is very easy. You just set up the route to your internet neighbor, and configure your encap address.

You will need some parabolic antennas for any great range.

10 Mbps requires a very large bandwidth, so whatever power
you are planning for, needs to take that into consideration.
a 100 mW Oscillator is pretty expensive.

Communications Quarterly, in their first issue had a really
neat audio design. They found that they needed to design a
tracking circuit to follow the other ends transmitter as it
drifted. They used Walkman type radios, and chose an IF in
the FM Comercial band. That is, an 89 MHz IF for example,
which then used the FM radios to perform all the rest of the
audio processing. FM radios today, require pretty good
stability, and the Gunnplexors are anything but stable in
transmit frequency.

I just checked, and my CQ collection must have gone out the
door with all the other magazines I finally got rid of last
month :-(

The Tiny-2 is a slightly modernized version of the old TAPR TNC-2.
All you need is a terminal program to run it. The command set should
be on the TAPR website. This is a good basic TNC, and should perform
better than a Baycom setup.

> Thanks!
>
> Mike

If you reduce the gain by applying max AGC, you have a zero gain amplifier,
which would seem to be of little practical use, since the input power and
the output power would be identical ...

The distortion products would virtually have to be increased, since by
definition, the amp would be operating at its 1 dB output compression point
(even with full AGC) ... that alone would cause an increase in distortion
relative to the +10dBm input signal (which had presumably not passed through
any
non-linearity such as an amp at its 1dB compression point.) Additionally, the
overdriving the input could also increase distortion and the AGC itself could
contribute, depending on how it is implemented.

The diddle, or blank character, combination # 32, is 00000, where 0 is the SPACE tone, or hex 00. This is in ITA2 code, the Baudot code used by American amateurs for RTTY. Over the air, don't confuse it with 11111, five MARK tones, which is the character for SHIFT TO LETTER CASE. The MARK tone is the higher of the two OTA. They will be reversed in audio frequency when received LSB. For USB reception the higher audio tone is the MARK tone.

Hope this helps. I got it straight out of the 1996 ARRL Handbook, page 30.38. In the same neighborhood are the ASCII code, and CCIR 476 which is the AMTOR code, and also the lesser-used International Morse Code characters such as the special Esperanto characters, non-english alphabet characters, and sledom-used punctuation. I had no idea we had an "underline" character for Morse!

The Baudot rates and pulse durations are also on 30.38

622. Re: RTTY Diddle?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-30 00:00:00 UTC
From: "Douglas A. Ford" <dford@tidalwave.net>
Message-ID: <34D1B97C.B326EDB7@tidalwave.net>
Source record: 25686

Marty,

To add to this, the "diddle" that you hear is exactly that character code listed below....but if that were all, you would only hear just a solid tone. The "diddle" part comes in to play, in part, because in the world of radio teletype, each character is preceeded and proceeded by what's called "Release" and "Latch" bits. Primarily, it's used as "sync" bits to sortof tell the rx station where it's at in the course of its txmission so as to theoretically give you a better read-out. Given that you're rx/tx'ing ITA2 RTTY, here's what you'd see (with "diddle" turned on in your software)...

For example, "00000" character code would actually be sent (depending on polarity) like this. Let's say you hear three diddle's...

```
1 0 0 0 0 0 0 1 0 0 0 0 0 0 1 0 0 0 0 0 0
^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^ ^
R I I I I I L R I I I I I L R I I I I I L
```

1 = Mark condidtion
0 = Space condidtion
R = Release bit (aka "Start bit")
I = Information bit
L = Latch bit (aka "Stop bit")

Hope this helped out :-)

Regards,
Doug Ford

Check out the FlexNet software. It supports using a sound card as the
modem part of the TNC, plus provides the software to do the rest.

I'm in the process of writing up an "experiences" document that
hopefully will help others install this package. But you can get the
excellent documenation at the following URL:

http://dl0td.afthd.th-darmstadt.de/~flexnet/

Good luck.

YO3FC de W2CS:

This is probably a very simple problem.

Look carefully at your path statement and make sure that you have
everything spelled correctly and that the semicolons are all in the
right place between the directories in the list. That's where I usually
make a mistake.

Failing that, are you certain you executed the command that loads the
driver? What I did was first get a clean boot with the new autoexec
(you did reboot, right??). Then I hand-entered from the keyboard each
of the FlexNet commands. They have to be executed in the right order,
too.

For example from my system:

```
flexnet
smsbcfdx /tc1
flex
fset mode 0 1200
fset txdelay 0 35
```

I haven't seen the source code, but perhaps you forgot the smsbcfdx (or
other modem driver command), in which case the flex command would most
certainly not find it!

Good luck and 73,

Gary W2CS

Serious omission on my part not to include that, Marty. hanks to Doug for
bringing it up. Only one more piece to fit into the puzzle... normally the
duration of the START bit in ITA2 is 1 1/2 times the length of STOP and DATA
bits. This aids in synchronization.

BTW, any clues as to exactly what you are working on? Getting curious here, Marty.

627. How do I set up Packet TCP/IP?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-01-30 00:00:00 UTC
From: olsen@topdog.cs.umbc.edu
Message-ID: <6athph$cm3@topdog.cs.umbc.edu>
Source record: 25691

I'm looking for help in using two MFJ 1274 TNCs to connect two networks using SLIP.

I have two networks in my house. One is mine, consisting of several Linux boxes. The other is my wife's computer running WIN-95. (My son's will soon join it.) Because of the layout of the house, I don't want to run cable, but use my two TNCs instead.

Unfortunately, I have so far been completely unsuccessful. I've never used TCP/IP over packet radio, and I don't know what to expect or what to do. For example, do I need to use callsigns to make the first connection, or will IP numbers work? Can I just set up regular SLIP connections between the computers and TNCs, or must I use specific software (like JNOS or WAMPES)?

I know that there are more elegant technical solutions to this problem, but I already have all this equipment and the link will probably be used only for mail to and from my wife's machine.

Any help will be greatly appreciated.

What am I working on? Well, it's a secret, so don't tell anybody...
;-) I'm going to make an attempt at writing an RTTY terminal program
using the soundcard for modulation/demodulation, tu run under 32-bit
Windows (95/NT). I know there are already some available - only one
Windows version that I know of and a few DOS versions. Don't ask why
- just sorta got obsessed with the idea and probably don't have enough
sense to know when I'm in over my head...

I'm months away from having anything useful - basically just gathering
information now and bugging the heck out of the folks on the comp.dsp
newsgroup as I try to learn about digital signal processing...

For the Linux side, see the AX25-HOWTO. You need to apply some kernel
patches and recompile, plus install a utility package. I haven't used it,
but think that etherax25 would be appropriate for the Win95 end. Of
course you need to set up the appropriate routing. Callsigns are needed
for the hardware addresses. You could get ampr.org ip addresses assigned
or just use some from the private network assignments, like 192.168.x.x if
they will only be talking to each other.

I have many restrictions on antennas etc. due to my HOMEOWNERS assosiation rules. I picked up a HAMLINK device at the Richmond hamfest that allows one to remote a base station via a TOUCHTONE phone. I know that the new KACHINA rig will be able to do this when they come out with the remote accessory but this device but the HAMLINK has been out for 4 years and there are some of them in use. Unfortunatley the company AEA went out of business and the successor company TIME WAVE is not manufacturing the HAMLINK at this time. Mine has been in the test mode for about two weeks and it works well. Any one out there using the HAMLINK or some other device to remote thier stations ?

Press Release

PacTerm ®98 for Windows 95, Windows 98 and Windows NT released!

New 32 bit Windows based TNC Terminal program is available NOW!

Lawrence, Kansas and Florence, Alabama. Febuary 1, 1998: Kantronics and Creative Services Software announce PacTerm ®98, the new 32 bit Windowsterminal program for the Kantronics TNC®s is now available. This new program takes advantage of the new features in Windows 95 and Windows NT,and integrates these features with the 'Host Mode' of the Kantronics wireless modems (TNC®s).

PacTerm 98 will requires Windows 95, Windows 98 or Windows NT with 8 meg of ram and 6 megabytes of free hard drive space. The program supports Com1 through Com35 and has 'point and click' commands for the VHF or HF modes that the Kantronics TNCs support. The program is written in robust C++, using the Microsoft Foundation Class Library.

A preview version of PacTerm ®98 has been in use since November,1997 and has been downloaded and used by over 3500 hams. The installed base of users that purchased the Preview version will be able to upgrade to the release version at no additional charge.

A suggested retail price of $69.95 will be offered to the amateur radio community for PacTerm 98.

Purchase can be made through Kantronics. The program also offers a demo mode which, while limited in functionality, will be free. Demo mode for packet
only will allow single port, multi stream packet operation for the Kantronics
TNC line. Purchase of the full featured version will include a free upgrade

to all updates up to version 2.0; hence users need not have to worry about upgrade costs and fixes with a version 1.x product.

The program is now available for downloading from the web at two addresses:

http://www.cssincorp.com/pacterm and http://www.kantronics.com.

PacTerm ®98 for Windows 95, Windows 98 and Windows NT host mode terminal program for the Kantronics TNC®s takes advantage of the true multitasking capabilities of Windows 95, Windows 98 and Windows NT and uses standard Windows commands for ease of use. From CW to HF packet, from single- to dual-port TNCs, it's now more fun to use the digital modes of amateur radio. Capabilities include:

G-TOR&#65533; and G-TOR monitoring
Multi-stream, multi-port support
Stream selection with a click of the mouse
Text and binary file transfers
User defined colors and fonts for received, transmitted and command text
Separate window for non-packet HF modes, from CW through NavTex
Multiple monitor windows (including network traffic window)

> would be appreciated. 73's de Gary KB1BMB

What TNC and software?
Have you checked to make sure the TNC and COM port are communicating at the
same rate?
Also, in some cases, the DSR/DTR lines may get in the way of communications.
Most TNCs
don't need them hooked up (just use TX/RX/Ground).

What are you sailing? From your e-mail address, I wonder if you're thinking
of going /mm with
packet. I did that for several years with great success.

Good luck!

Hello,

I have a Timewave 59+ DSP filter for sale... I have had the unit for less
then a month but ICOM has come out with a new DSP built for my 706MkII.

The Timewave 59+ works and looks as new....

$160 + shipping I want it to move....=)

Dear All,

Help,- look in your IC bits boxes etc. I need a couple of old 3850 Microprocessor ICs may also be know as MK3850 (made by MosteK) but also made by others about 8-10 years ago.

I am happy to pay for these to get my receiver working.

Please reply be e-mail as well as these newsgroups expire very quickly on my server.

Any 3850 that you get from someone's junkbox is liable to be useless to
you. The 3850 used a built in prom code burned in and not changable. A
few had a socket builtin to the top of the chip to mount an eprom but
they were rare.

You are probably out of luck if you cannot get one from the radio's
manufacturer or from a scrap radio of the same type.

655. 150 MHz FM receiver for POCSAG pager needed!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-01 00:00:00 UTC
From: ecn@bis.bg
Message-ID: <01BD2F66.EE8168F0@HOME>
Source record: 25719

Hi All,

My name is Evgeni Nikolov. Currently I'm working as an AS/400 programmer for Deloitte & Touche. In my free time I use to do some programming on PIC16F84 microcontroller (http://www.microchip.com/10/Datasheet/PICmicros/PIC16F8X/PIC16F84.htm) . Now I am working on a project witch combines PIC16 and a FM receiver. Together they can receive and decode POCSAG-coded paging messages from national service provider (in Bulgaria there are several). The digital part of the device is almost ready. But I have very litt
le experience with RF devices, so I need help very much.

The module I'm looking for is RF receiver and FM demodulator for 150.175 MHz. I prefer to be able to tune to different frequencies. The step is 20 kHz and deviation is 4 kHz. I2C protocol is preferable but any other is OK. I found many pager receiver chips, but they are rather complicated (have more than 10 coils) and don't have any tuning capability.

After some research I have found two chips from Phillips (TSA6057 and TEA6100 http://www-us.semiconductors.philips.com/cgi-bin/newsearch/pip?typenr=TSA6057&search=TSA6057 and http://www-us.semiconductors.philips.com/cgi-bin/newsearch/pip?typenr=TEA6100&search=TEA6100). But as far as I can understand they need extra elements and I don't know how to connect each other. So - that is. Help!

Of course after (if) I finish this project I will publish it in my web page ((http://www.bis.bg/~ecn) for free and everybody will have it.

Thanx in advance.

Evgeni

I bought some X band Gunn diodes at Birkett (01522 520767)
last year for a few quid each. They were amused at this
perfectly strange Canadian wandering in to their store,
especially since I had come to Lincoln (en route from London
to Newcastle) just to see them...

Mainline (0116 2777648) usually carry them too.

The one I have here does not have a coded EPROM burned in. I have a detailed schematic in the manual, just a pretty standard 8 bit micro of its time it is from something called the F8 range which included the 3853 SMI chip as the 3850 has no address bus and the 3861 PIO. The EPROMs in this application are external and are standard 2716s which I have by the way blown copies of.

Just wondering if someone _knows_ if it's possible to push a HTX-202 into 9600bps using the VOX interface (soundcard audio out -> HTX-202 Mic input). I know 1200 is all that's recommended because of the high output needed by the soundcard, but what risk do I run if I try to push 9600? A fried soundcard, fried interface, or fried HT? Thanks for any info.

I agree with Burt. One of the Motorola radios used this same processor
with built in code to run the PL/DPL/Tone burst deck. It definatly had
masked rom in it. No changes. I agree - you really need to find the
exact part from another radio/equipment to make it work. No subs.

: Just wondering if someone _knows_ if it's possible to push a HTX-202
: into 9600bps using the VOX interface (soundcard audio out -> HTX-202 Mic
: input). I know 1200 is all that's recommended because of the high
: output needed by the soundcard, but what risk do I run if I try to push
: 9600? A fried soundcard, fried interface, or fried HT? Thanks for any
: info.
:

A HTX-202 will certainly do 9600bps, after modification. The
9600bps node in my basement is proof of that.

On the other hand, you simply cannot do 9600bps through the mic and
speaker ports, period. Why? Because the audio pre-emphasis and
de-emphasis circuitry, among other things, distort the signal into
unusability. If you want 9600, you need to tap the discriminator. It
took me about 20 minutes to locate the appropriate taps and to make the
cable.

As for possible damage - you won't hurt anything. Just because
you're trying to generate higher data rates doesn't mean that you're
putting out more power. Whoever told you that it does, was highly
mistaken.

- Rich

Just curious, but did you happen to document the needed mods? I solder and probe with the finesse of an elephant on things shrunk to that size. If I thought the mod was clean enough, I may would try it instead of a data radio to play with 9600bps.

Thanks,

David

672. Any advice on 60Hz hum from TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-03 00:00:00 UTC
From: reaper@speakeasy.org
Message-ID: <6b80ge$280$1@betty.speakeasy.org>
Source record: 25637

I recently acquired a Kantronics KPC-2 and Regency BTH-201B crystal-controlled 2m radio (currently crystalled for 145.01), which I am trying to use to learn packet. I have noticed, however, that the TNC appears to be introducing some kind of hum (I'm guessing 60Hz but haven't the equipment to verify that) via the TNC <-> radio cable. That is to say, with the squelch open on the radio, when I plug in the TNC cable, i can hear a slight buzz or hum added to the white static noise.

This hum seems to vary in intensity, ranging from slightly annoying (but squelch will conquer it, and it doesn't affect the incoming signal too strongly), all the way to impossible (incoming signals are obliterated and turning the squelch all the way up won't eliminate the hum). Unplugging the TNC cable from the radio completely eliminates the hum (listening to the open-squelch reception). I noticed this problem for the first time when plugging in a more permanent antenna (had been using an MFJ 1/4 wave mag-mount temporarily): a 1/4 wave ground plane attached to 50' of RG-58, with about 30' of the cable coiled up near the radio. Subsequent swapping of antennas had no noticable effect on this hum problem.

I currently have two suspicions: 1. I think the cable between the TNC and radio may be bad, since wiggling it around causes differences in the hum (but this may also be some sort of RF interference trick); 2. I found that the voltage regulator in the TNC has been replaced, and the replacement soldering job may not be done well enough, causing some sort of loose-connection hum. Unfortunately, I lack the necessary oscilliscope to check these things out. (But the TNC does receive the proper voltage, and appears to have no operational difficulties before any interaction with the TNC <-> radio cable.)

Another thought which has occurred to me is that the wall-bug transformer may be introducing some hum, and to the end of testing that theory, I've purchased several used gel-cells (but they're not charged yet). Measuring the AC voltage on the voltage regulator, I discovered .236 VAC on the 12 VDC leg, and .002 VAC on the 5 VDC leg. However, the output of the transformer (no load) is only .038 VAC.

So, basically, my quesion is: has anyone else experienced problems like this? If so, what sort of solution was found? I am planning on replacing the cable, but if I can avoid that trouble, I would be pleased. It would be great if I could get this setup working reliably. Feel free to either email suggestions or post them to the newsgroup. Thanks in advance for any help you can offer.

We have the same problem with an MFJ TNC. It's the 1200BPS model... an oldie, from way back, it has DIP switches to set baud etc... and max baud to terminal is 9600.

We run two of them side-by-side. We have switched cables, radios, and the TNC produces a loud 60Hz hum out of whichever radio it is connected to.

Also noted some burnt-looking resistors near the rear of the TNCs (near the comm ports on the boards) but that happened in both TNCs and if we swap the resistors out the problem isn't affected.

Anyone know why we have hum, and why a couple resistors would be burnt to a crisp in both TNCs?
Joe

I've had a chance to further experiment with my setup; I've now tried running the TNC from a battery, and not surprisingly, the AC voltage I had seen on the 12 VDC leg of the power regulator is gone. However, the hum coming into the radio via the TNC cable is still present, which I take to mean one of two things. Either 1. the cable is picking up AC from the room, or 2. the TNC is generating some kind of clock signal for its CPU which is leaking into the audio circuitry.
I've received two suggestions for possible fixes so far, one saying that older KAMs suffered from this problem because of burnt-out filter capacitors on the regulator (but I think that possibility was eliminated by using the battery and the problem persisting), and the other suggesting a new wall-bug transformer, since the old was was probably not fully rectifying.
At this point, I'm going to assume that the cable is the problem, since I don't fancy wiring up an AF notch filter (the only other solution I've come up with) to conquer CPU noise. If anyone has any further suggestions, please let me know; again, either email or posting to the newsgroup is appreciated.

Hi Mike,

I do run PcPackratt 2.0 under Windows'95 (SR1). I use it with my DSP-2232
and I haven't had any problems with lock-ups, etc.
All I can suggest is that you carefully check the parameters and ensure that
they match those of your COM port. My installation went very smoothly... and
the program worked the first time... once I had completed configuring the
interface parameters.

My system is a homebuilt P5-133 w/48Mb... and a lot of TSR's running ;-)

: : Is there a source for a 9600 baud mode for the Radio Shack htx-202
2m
: : handheld?

: There probably is but I hope you're good at micro-surgery HI.

I wouldn't exactly call it micro-surgery. It's a wee bit tight,
but a
steady hand and a magnifying lense was all I needed (and a soldering
iron).
Actually bringing the leads out of the case is the tough part, as it's
pretty tight in there. Here's the how-to I've had lying around for some
time. Obviously, I'm not the author, so credit where credit is due.

==========

From: Gene Kennedy <Gene.Kennedy@f470.n3625.z1.fidonet.org>
Date: Wed, 30 Nov 94 06:04:00 -0600
Subject: 9600 Baud
Organization: Di's Online Cafe - Mobile, AL - (205) 661-8945

To Steve and others who may be interested, heres how I connected my 9600
baud TNC to my HTX-202:

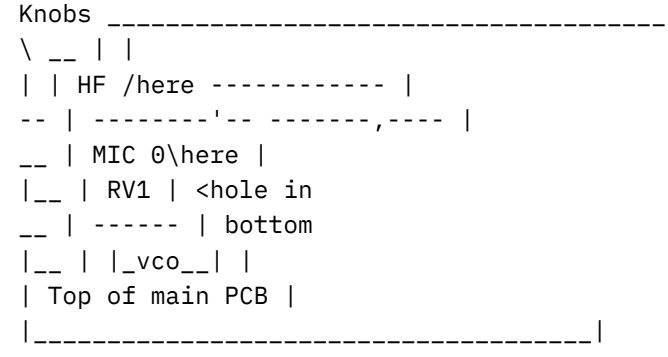
CONNECTIONS TO REALISTIC HTX-202 FOR 9600 BAUD PACKET

NOTE: The following operation requires soldering in very close quarters and damage or destruction of your radio is possible if you get too much heat on nearby wires or components, or by sloppy soldering.

I performed these operations on my own HTX-202 and it works OK for 9600 baud operation with my new Kantronics KPC-9612. I don't take any responsibility for invalidation of warranty or improper operation of the radio, etc.

I studied the schematics and determined the locations for making connections based on general recommendations for 9600 FSK. I didn't want to permanently deface my radio by making any holes in the case for wire penetrations, so I removed the battery and battery connector which is a plastic oval with a spring contact in it held by two screws and ran the wires out to the connector that goes to the TNC. I can restore it to original condition in just a few minutes. I used the smallest coax I had avail, I think it is RG-174. Someone may have a better idea about doing that part.

Open up the HTX-202 by removing the five screws, take off back cover, and separate front panel and lay it on bench so that flex pc cable won't be damaged.



This is a crude diagram of the inside of HTX-202 after splitting case and folding front case aside. There are several sub-PCBs standing on edge that I represented by the dashed lines. In my HTX-202 the sub-board at upper left is labeled HF and the raw output from the discriminator IC goes into pin 1, the first solder pad starting from the center of the radio. This is where I soldered a small coax and ran it out the hole in bottom of case. This is Receive Audio into TNC.

The sub-board labeled MIC is microphone audio to modulator varicap. Pin 6 here goes directly into the VCO and this is where I soldered a second coax. The solder pad 6th pin from center of radio is right next to the RV1 deviation pot. (Dont melt the pot.) This is Transmit Audio from TNC.

The third connection, PTT, is harder to describe the actual point. What I did was flip the radio over and used a ohm meter to locate the solder trace from the center pin contact of external mike socket. It runs from just below mike socket to a small SMD resistor. I soldered a 2k resistor here and ran a tiny wire from other end of it, along the

side of radio and out a slot in case where the cover wouldn't pinch
it, and through the hole in the bottom.

The radio now has to be operated by a power supply, since the
battery contact is gone and the wires are coming out the hole in the
bottom. I lengthened the power wire that was removed from the contact
and connected it to the same power supply as my TNC. The coax and PTT
wires go to the DB15 connector for the KPC-9612. I used the coax shield
for RX Audio as the ground connection, but left the TX Audio shield
un-grounded at the DB15.

I am still in the process of evaluating how well this works on 9600
baud packet. There are very few VHF 9600 baud stations near me (only
one, in fact) but hopefully in the future this will change.
Good luck, and I welcome any feedback about this.....

Gene, WA4WBI
==========

....rvz here again....

I followed these directions, and receive works just lovely. I've
only
managed one connection though, not sure if it's a problem with the
hookup,
or just my measly 30 watts not doing the job. Much like Gene, I'm
having a
hard time finding other 9600 activity close by. Anyone know of activity
in
the Northern 'burbs of Chicago?

Couple of notes... Although it's probably necessary to pull the
front
off the radio just to identify the proper points, I made my connections
on
the rear of the board that's exposed immediately after removing the back
cover. Be careful with the routing of the rg174, paying attention to
what
will be crimped when replacing the cover. A friend smoked his when he
screwed the cover back on (what's an ERR 01 mean?), piercing the cable
with
one of the ic pins. I also didn't bother running the PTT cable out as
Gene
describes. I put a plug on the end of PTT lead from the TNC, and use
the
microphone jack on the radio instead.

good luck,
rvz N9ORG

Greetings

Sounds like you have an earth loop here.

Someone else suffered a burnt up TNC in this thread and I've seen
this when the ground return for the radio was faulty and the 5 amps
TX supply returned thru the TNC ground and cooked the PCB.

Check that the PSU and earth conections to the rig are OK and that
the antenna is not picking up mains volts from somewhere that is
then being shunted down the TNC ground to the computer.

Lots of possabilities with the computer ground, TNC PSU ground, rig
PSU ground and coax braid maybe grounded somewhere as well!!

Greetings

Sounds like you have an earth loop here.

Someone else suffered a burnt up TNC in this thread and I've seen
this when the ground return for the radio was faulty and the 5 amps
TX supply returned thru the TNC ground and cooked the PCB.

Check that the PSU and earth conections to the rig are OK and that
the antenna is not picking up mains volts from somewhere that is
then being shunted down the TNC ground to the computer.

Lots of possabilities with the computer ground, TNC PSU ground, rig
PSU ground and coax braid maybe grounded somewhere as well!!

683. Pactor-II

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-04 00:00:00 UTC
From: Erik Skovgaard <Erik_Skovgaard@bc.sympatico.ca>
Message-ID: <6bb9ff$82q$1@news.bctel.net>
Source record: 25648

Since I am considering investing in a new HF digital controller, I have a couple of questions:

1. Can someone tell me how many amateurs are active on Pactor-II?

2. Can someone convey some experiences with the PacComm Pactor-II controller?

Thanks & 73 de VE7MDL ....Erik.

685. Is QPSK sent as SSB??!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-05 00:00:00 UTC
From: electron78@aol.com
Message-ID: <19980205020800.VAA11338@ladder03.news.aol.com>
Source record: 25650

When digital signals, such as QPSK, are transmitted, are they sent in single sideband suppressed carrier? If so, how do you get a stable carrier (at microwave frequencies) in order to demodulate the signal? As I remember, as small as a 100 Hz off and the signal begins to go downhill fast. How is it done in the microwave region?!

Thanks!

Mike

73 de Juergen

We were discussing this off and on here, Juergen. One problem is that some of the newer computers cannot supply the current needed for the interface, and so an external power supply must be used, and current limiting resistors for keying transistors must be increased in value within the range where the transistor will operate. Another problem is that the serial port wants to see a higher voltage signal than what the device provides, and therefore requires, again, an external power supply. My old 486 Toshiba Notebook and my old 286 true-blue IBM clunker both were FB with Hamcomm using the standard interface that takes power from the RTS and DTR pins for operation. The two Pentiums I have owned since perform poorly with the standard device, and the one I have now doesn't even like the version that uses two 9V batteries. Try two small (I use 300 ma units) 12 Volt transformers. Hook the primaries in parallel with one another, and the rectified and filtered outputs in series. The connection point is common, and the other two leads provide + and - voltages. You could regulate them if you wanted. A pair of 9V transformers would probably work too for most computers.

When things seem to hang up on you, try hitting F3 to get back to CW and toggling TX on and off a couple of times. That sometimes gets things percolating again.

The program really does seem to work best with a 386 or 486 based system running DOS. It is quite trouble-free in that environment.

Good luck Juergen.

Source record: 25652

I am running a Kam All Mode and an old Packet Communicator on three frequencies to my Mars BBS using Msys 119 and have no hum problems. This is really stretching it out. My suggestion would be the same as the Brit's. Check out the ground circuit on your connecting cables. Try hooking up a wire between the ground and your TNC and also between the TNC and the computer. I feel reasonably certain that this is where you will find the solution.

Good luck and drop me an email when you find the solution.

Stay away from the PacComm PTC-II!!!!!!!!! It has bugs which PacComm has yet to correct. In addition, PacComm indicates they are not going to support future SCS upgrades to their unit. I have an SCS PTC-II which works great. I have downloaded and installed firmware upgrades from the Internet several times with complete success. Check the SCS web page at www.scs-ptc.com. PinOak digital is the U.S. distributor for SCS. My understanding is that if you order via the SCS page it will be shipped by PinOak.

There is a fair amount of Pactor-II activity which is growing every day. The nice thing is that it connects in Pactor-I as well so you aren't limited in finding QSO's. All the other modes work well, too. The CW decoder is the best I have seen. The tone freqs are completely adjustable so if your rig can run a 500 Hz filter in SSB mode then you can center the tones to match your filter. I find a big improvement during heavy QRM with the narrow filter in the transceiver.

I run a Kantronics 9612, and am curious whether one can run dual windows software with it. This TNC has only one serial port...the 1200 bps and the 9600 bps data is seperated by a "/1" or "/2" text suffix on each packet to the terminal screen.

Any way to make dual/split windowed software work with it...and if so, which one.

Thanks much, & 73.

Source record: 25664

The Netherlands, February 6, 1998.
Hello dear reader,

NET/Mac v2.3.65 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- For those that want to override the Macintosh-type that NET/Mac has
reported, there is now a new command: mactype

- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

The latest version of NET/Mac can be downloaded from my homepage:
http://www.caiw.nl/~adam

This version obsoletes all versions of info-mac/comm/inet/conn/radio-net-mac
in the Sumex-Aim.stanford.edu (and it's mirror-) archives.

It also replaces /pub/mac/_communicatie/_internet/radio_net_mac_23xx.hqx
on ftp.idg.nl.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
- wa2zkd mirrors UCSD's incoming on his Landline BBS. Ham's w/o ftp
can call 716-544-1863 or 2645.

NET/Mac will be uploaded to PI1HVH.AMPR.ORG, directory c:/public/mac.

Adam PA2AGA e-mail: a.vangaalen@nitg.tno.nl for mail to my office
or: adam@caiw.nl for private or hamradio mail

Feroz,

I have had mine for a couple of years and I have never noticed any particular bugs.

The unit works fine for all the modes I have tried: Clover (II), Pactor, Amtor and RTTY. I have never actually transmitted RTTY, but it works fine for receiving signals.

I often use mine to receive Navtex at 518 kHz (in Amtor mode) and it picks up signals that are weak and even performs well through electrical noise.

The supplied software is a little on the primitive side, so I would recommend the XPWARE software for any serious usage.

The other thing to note is that the P38 downloads the software from the PC and it takes quite a while, so switching between Clover and any of the other modes is rather slow. This has to do withe speed of teh PC bus and the P38 on-board monitor software, so I don't think it can be improved, although Hal may be able to improve it.

<19980205020800.VAA11338@ladder03.news.aol.com>...
> When digital signals, such as QPSK, are transmitted, are they sent in single
> sideband suppressed carrier?

The carrier is suppressed, but it is NOT a single sideband signal ...
the data causes both upper and lower sidebands around the suppressed
carrier position ...

> If so, how do you get a stable carrier (at
> microwave frequencies) in order to demodulate the signal? As I remember, as
> small as a 100 Hz off and the signal begins to go downhill fast. How is it
> done in the microwave region?!

Systems using BPSK/QPSK, etc. must track the carrier frequency of the incoming
signal and generate a local carrier reference to use in the demodulation
process.
Try doing a search on "Costas Loop" on AltaVista or one of the other search
engines and I'm sure you'll turn up a lot of information ... you can also
check the TAPR web page and order Tom McDermott's book "Wireless Digital
Communications: Design and Theory" ... it's an excellent tutorial/intro into
most aspects of digital communications.

Hi, I've been using Paket 6.1 program and Kantronics KPC-3
and all has been working fine. When I went to use packet
the other day the program come up with a box that said " The
TNC is not responding" and there is no communication between
computer and TNC. But when I use Log-Eqf logging program
which has a built in packet the TNC works fine. I have the
comport setting the same in both programs. I have deleted
Paket 6.1 and reloaded it, but it still does not work in
windows95 or dos. Any ideas?? Tnx, Bill

Hi Gary

I had no problems running my PK-232MBX running under Win95 using
Packratt II as year and a half ago. It's a plain old DOS app and I
anticipate no problems next month when I will be QRV once again. The
intention is to run Pakratt II on a laptop with the 98 beta as the OS.

What sort of problems are you having?

As a casual observer of this group and the topics, I would guess your tnc has been left in host mode, upon exit from your other proram. Consult the manual for the tnc, and see if a sequence of key strokes or command(s) is provided to return the tnc to its native or command state.

I'm quite pleased with mine. I use it virtually every day. It works
fine in Clover II, works very well in RTTY and AMTOR, and the
current software works well in PACTOR I (there were problems
with early software versions). Operationally, the P-38 is easy
to use.

But if you can forego Clover II, and you have a Soundblaster
card, I'd suggest you take a hard look at Brian Beezley's
RiTTY. It does RTTY, AMTOR, and PACTOR I, and it does
them very well for less than half the cost of the P-38 card.

725. MFJ 1276 Pactor doesn't work

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-09 00:00:00 UTC
From: calypsonia@aol.com
Message-ID: <887071329.364511236@dejanews.com>
Source record: 25591
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.digital

I have an MFJ 1276 and am experiencing problems with the Pactor mode. The modem works fine in HF & VHF packet mode. It will also receive Pactor, but fails to work when I want to transmit Pactor.

In Pactor mode:

If I try U1 or U2 mode, The PTT and STA lights come on briefly (1 or 2 seconds) then go out, and I'm returned to the Pactor startup message and p_cmd prompt.

If I try connect in Pactor, the PTT light starts blinking on and off with approx 1 second period, and the STA and CON lights come on. After a number of cycles, I am returned to the Pactor startup message and command prompt. The number of cycles before tripping varies. On rare ocasion it actually persists long enough to report "retry limit exceeded." When I do start to get a response from the called station, the modem fails to establish a connection, and always carashes out giving me a new Pactor sign on message and p_cmd prompt.

I think several other people have experienced these same symptoms, but I haven't heard what the resolution is. Hopefully it's just firmware update or a settings change.

Regards,

Jeremy, AA1RU

Have you tried Kentrol 5.3? I use it for my R-5000 and it works pretty
well and adds significantly to the functions of the receiver. For
instance, you can tune by band (BC, AIR, Marine, Ham phone, Ham cw, etc.)
and you can store multiple memory sets instead of just 100 channels and
load whatever set you want. They have a web site.

Brian Denley

728. HELP!, Power meter problems URGENT science fair help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-10 00:00:00 UTC
From: John Lauber <jlauber@execpc.com>
Message-ID: <6boe5q$pkb@newsops.execpc.com>
Source record: 25594
Cross-posted to: aus.radio.amateur.wicen,git.radio.amateur,mcgill.amateur-radio,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.mi

I need urgent help to get me off on my science fair project.

I have been doing an experiment to test the resistance of different materials to an airborne signal, but I need serious help on the apparatus. First I tried a baby monitor and used an amplified microphone to pick up variances in the volume of the signal (audible), then measured the output of the microphone on a voltmeter. A very simple and indirect way of doing it. It worked, but it didn't seem to pick up enough change, and my preliminary testing resulted in less than desirable results. Second, I tried measuring the strength of a CB signal with a wattmeter, but the wattmeter had to be wired inline between the transmitter and antenna, not what I wanted to test. Is there any piece of equipment that measures the strength of an airborne signal? Am I setting this up right? (see diagram below)

```
------------------- | | --------------
| transmitter | | Block | | receiver |
------------------ (lead etc.) ---------------
```

Is there a wattmeter or other piece of equipment that will take the place of the receiver and give me a reading of the power of the signal, either precise or relative? I need some form of project by 2/17/98, and a good one by Feb. 23. I urgently need any help you can give me. Thankyou.

Please respond to jlauber@execpc.com .

Sincerely,

Dan Lauber

I have them both. I second everything Gary says about both the P38 and
RITTY. Except for one thing: RITTY does not do AMTOR. Only Pactor I and
RTTY.

Use a field strength meter to measure the signal. I think Radio Shack still has an SWR meter that has a field strength position with a small antenna. You should also be aware that the experiment will be hard to control if you are just placing a piece of material in the signal path. Signals will bounce around the room, reflecting off walls and such, and find paths between the transmitter and receiver other than the direct one which you are trying to attenuate with the material. The best way may be to place the transmitter inside a box made of the material.

Good luck.

There's not a lot of AMTOR any more (by comparison). Your primary digital modes are RTTY and PACTOR-I. Check out RITTY before you purchase anything.

I have an early P38 which works fine. There was a problem in the early units with intermittent tantalum capacitors which sometimes shorted and caused the computer to re-boot even if you are not using the P38 at the moment. HAL knew of the problem and replaced the capacitors under warranty. No problems since.

735. all around TNC suggestions?, newbie

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-10 00:00:00 UTC
From: Lab Assistant <gte900f@prism1.gatech1.edu1>
Message-ID: <34E08070.5305@prism1.gatech1.edu1>
Source record: 25601

I am looking for some suggestions for a TNC that can cover most
everything that I may want to operate in the near future. Maybe
that is a bit too much. :) I want to buy a TNC that will do basic
packet/digital HF/VHF, satillite and APRS. I know that as I learn about
what is
available I will want to try out new things. If possible I want to
be able to already have that capibility and not have to buy several
hundred $$ of new equipment.
Is it worth it to get built-in DSP (I think an MFJ has this option)
or 1200, 2400 or 9600 baud?
I have had limited experience with a MFJ-1278 from my brother.
I was thinking about this model with the DSP filter and possibly
a modem upgrade??
As usual money is a factor. :(so give me a reasonable suggestion
and a dream suggestion.
I currently have a dualband HT, dualband mobile (FT5100), IC-725
and an old icom 2m all mode.
please reply to:
gte900f@prism1.gatech1.edu1 (remove the one's from the address)

Source record: 25602
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Bill:

Are you sure the COM port settings are correct on the Paket 6.1 program? I know that users of our Packet Magic program have sometimes had problems because they set up PM "just like their other packet program", rather than actually paying attention to the baud rate and other parameters that they need.

For example, on some software you can set up a speed of 9600 (or anything else) and still run 1200 baud packet because the software and or firmware on the TNC outthinks you and sets the speed to 1200 baud regardless of what you put in. If I'm not mistaken, Paket and many (most) other programs require you to actually put in the speed you are running. We just had a guy who refused to believe that he was running 1200 baud packet because the "old program ran with a setting of 9600". (Neither his TNC nor his radio were even capable of running 9600 baud packet). Rather than simply setting the thing to 1200 as we suggested, he returned the program.......(!!!!)

You might also try using Windows Terminal with the same settings as what you are trying to use with PakRat. If Terminal works and Paket does not, Paket is fouled up. **I would suggest to all users that they troubleshoot these problems using the most plain vanilla terminal program to make sure their settings are correct. It does not pay to use the enhanced programs to troubleshoot connection and settings problems because almost all of us slick publishers like to code little toys into our programs to show how brilliant we are, and you never know when the "enhancement" is the problem and not something you did**
Good luck es 73 de Dave

The receiver itself is usually the most sensitive field strength meter
you can find. The problem is to find that portion of the circuit that
is a good indicator for received signal strength. If you have enough
power available to use just a simple 1N34 diode detector with a
sensitive voltmeter, that would be the simplest way to go. The small,
battery operated digital VOM's that can be purchase as cheap as $15 or
less, will have a sensitivity of a few millivolts. If your
transmitter is capable of 5 watts, for example, you will have no
trouble getting good deflections with a small whip antenna (a foot or
two long), a 1N34 diode and the millivoltmeter range of a VOM.

I am trying to fix up an old AEA CP-1 "Computer Patch" to work with HamComm for a friend. I have run into a problem getting the HamComm to toggle the '2206 via the RS-232 port. I can see fluctuating RS-232 signals on pins 10 and 11 of the 75152 but I have no reference material on the 75152 itself to know what these pins are. Does anyone have a pin-out (with function) for this I.C.? Likewise, has anyone else used HamComm (ver 3.1) with the CP-1?

>There's not a lot of AMTOR any more (by comparison). Your primary digital
>modes are RTTY and PACTOR-I. Check out RITTY before you purchase anything.

Note: RITTY is a program
RTTY is radioteletype

Bob is correct that Pactor-I and RTTY are the primary modes now. There still is some AMTOR--enough that I have to switch from the RiTTY program to the P38 to copy it.

I prefer to use RiTTY on Pactor and RTTY, because the program does some digital gymnastics that make for better copy under cruddy conditions. I switch to the P38 for AMTOR or Clover. Neither device does CW.

I really like Clover. There's not much Clover activity I can hear up here in the Northwest. Too bad, because Clover is a sweet mode. You hear a long packet, the signal breaks up periodically, there are a couple of static crashes, and you think, "oh well, that will never get through." Then the text appears on your screen. Nice!

I must also remark that when Clover links fail, I have several times switched to dumb old AMTOR and continued a QSO. Sometimes brute force and tenaciousness wins over smarts :-)

Anyway, RiTTY is a DOS program that runs in graphics mode. It does not multitask under Window 3 or 95. You can task switch away from it *if* you suspend it when it's in the background. It has a Fourier transform display for tuning which is almost as good as a scope, and a packet display that also shows lots of useful information. It really looks cool! Watching the displays is part of the fun of using RITTY, and it gives you a "feel" for what's happening like nothing else I've ever seen.

RiTTY can use most SoundBlaster "clones" for RTTY, but needs a name brand SoundBlaster for Pactor. The SB Vibra 16 is relatively cheap and does the job just fine. A fast 486 or middling Pentium is desirable for all processing and filtering features to work. As I said before, RiTTY does some really nice signal processing and decoding tricks that make for much better copy under lousy conditions. I've had smooth (though slow) Pactor QSOs with Australia at night on 20m when I could barely hear the signal.

RiTTY also allows you to change your tones to anything you like. I center mine on 700 Hz, which is easier on the ears than the normal 2210 center frequency and puts them in the center of my CW filters.

When *monitoring* RTTY and Pactor, RiTTY will often show a bit more than the P38, and you know where the "gaps" are. The P38 doesn't show the gaps, so if packet #2 was bad, packet #1 runs right into #3.

The P38 is no slouch, by the way. It's certainly better than any popular analog TNC. It does RTTY, AMTOR, Pactor I, ASCII, plus Clover. The tuning indicator is good, but not as intuitive as RiTTY's. It takes some practice, and you have to tune very slowly. The P38 keeps its code on disk, and you load it into RAM on the card each time you start up, and each time you switch from FSK to Clover and back. That takes about 10-14 seconds. HAL's more expensive Clover boards have the code in flash ROM.

The P38 does not use an interrupt, only a few bytes of I/O Ram. The software just polls the card. This makes it pretty low-impact. The card is full-length, so you need a completely unblocked ISA slot in your PC. The DOS software that comes with it is a little clunky, but works well, an the tuning indicator in it works very nicely. It multitasks beautifully under Win95, tolerably under Win3 (on my machines--your milage may vary.) Since it does the signal processing on the card, and the PC is only handling character I/O and display, it will probably work on any old 16-bit computer.

If you get the P38, I recommend XPWin. This is a nice Windows-based program that gives you a common user interface for the P38 or any other popular commercial TNC.

The P38 costs $350 new, but they were selling it for $300 around Christmas. Used ones go for $250 or so. Compared to the cost of a SCS PTC-II for Pactor II (~$1000), it's a very attractive way to get on an advanced digital mode.

RiTTY costs $150, and you can download a trial version from the Web site below. XPWin costs $45 to register, and a trial version works 100 times.

For more info see the following Web Sites:

You have a pretty decent setup for basic digital comms, John.

The problem you are having with CW is the TNC cannot adapt to rapidly changins speeds or tming. Elements (spaces, dits, and dahs) that are not of the length that the TNC expects to see are "confusing" to it. The unit attempts to adapt by keeping a sort of floating average of speed, but adaptibility is nothing like that achievable by the human ear.

I really think there are programs that do a better job on CW than PAKRATT. I think highly of Hamcomm for this, and there is another program mentioned in the HANDBOOK that is supposed to work FB with an interface hardly more complicated than the Hamcom device. The article begins on page 22.24 in the '98 hanbook. The program is by Ralph Taggart, WB8DQT.

You will have better luck decoding CW that was sent by computer or keyboard keyer with type-ahead buffer. Hand-sending, even with paddle and electronic keyer, often results in code that sounds great and is easy to copy but chokes up your computer. I have had a couple of 50 WPM QSOs with other ops using computers. With a good signal, copy can be as much as 95%.

RTTY does not have the error correction found in AMTOR or other more advanced digital modes. A noise hit will trash the character being received. Try changing your rig's setup, i.e. try a narrow filter, (you may have to have and use IF Shift to put the passband on the tone frequencies) try changing the AGC time constant, etc.

If you are using USB, be aware that the convention is to use LSB. You will have to set REVERSE mode to flip the tones right-side up again if you insist on using USB. In LSB, the TNC expects to see the Mark tone at 2125 Hz and the Space tone at 2295 as per the old convention. You will have to estimate with the LEDs on the front panel of your PK-232. You should see two tones of equal brightness at equal distance from the edge of the display.

Make sure you are set up for 170 Hz shift and 45 baud for amateur RTTY.

Do you have tthe manual for the PK and the manual for PAKRATT? You will be hard pressed to understand every single wrinkle of the setup with just one quick read. Hit the books and try different stuff.

Have you tried Pactor or Amtor with your setup yet? If you are succesful on those modes that at least means there is nothiing wrong with your hardware or connections.

The main Pactor band on 20M is 14.065 to about 14.083 with
070 to 080 the most popular area.

Try calling CQ in PacTor FEC somewhere around 14073 or so.
Someone will come back if conditions are halfway decent.

Also, you might try downloading XPwin from KG7XP's website.
It is a free trial kind of deal, and it is much better
software than PC Packratt.

Also, none of the TNCs are much good for copying cw, but
then again who cares.

Hope this helped.

Jack,

I'm in the process of developing just such an application. It will be compatible with CE 1.0

Generic TNC: Basic Support

Kantronics TNC: Full support including A/D and I/O Lines

Without going into alot of technical details, if you own a Ten-Tec 2M 1220 Kit, I have engineered a RS232 PassThru/Adapter that allows the following:

Equipment Used: KPC-3 Plus, TenTec 2M, Casio A-11

Full TNC support
World Time Display (Multiple regions simultaneously)
Station Logging
Sat. Tracking (up to 6-12 simultaneously, depends on HPC CPU speed)
Day/Night DX Line against world map
Limited Propagation prediction (still in the works, hard to reduce code size)
Full control of 1220 2M unit (scanning, virtual S-Meter, offsets, memory groups)

I will be looking to expand the 2M units support once I have time to look at
interfacing options. However, this was more an effort for myself using the TenTec kit. I will off this up as shareware within the next few months and look
for beta testers soon.

Well, I'm not sure it's what you're after but I have a brief description
and schematic of a BER tester I designed and built several years ago on
http://www.tapr.org/~n6gn/bert/bert.html

This is under the 'old hardware' section of my higher speed packet pages
http://www.tapr.org/~n6gn/index.html
and you're welcome to take a look.

I used the BER tester for measuring and aligning the digital radios I
built as part of our local 230 kbps RF tcp/ip network.

```
Upcoming Gordon West Radio School Classes
=========================================

Gordon West, renowned author, teacher, speaker, and amateur radio
operator, will be hosting a Radio School licensing and upgrading class in
Orange County, California (for other dates and locations, see the end of
each class description).

Two classes will be held at Fry's Electronics, 3370 East La Palma,
Anaheim, CA 92805, one for the No-Code Technician License, and one
specifically for General Morse Code (13wpm):

Weekend Technician No-Code Class
--------------------------------
Date: Friday 6th, Saturday 7th & Sunday 8th March

Everything you need to get your Technician No-Code FCC amateur radio
license will be covered in this exciting two-and-a-half *full* days of
class! Class starts on the evening of Friday 6th March, and continues on
both Saturday and Sunday.

The exam questions are taken from the FCC Novice Element 2, and Technician
Element 3A question pools, all of which are covered in the exclusive
Gordon West Technician No-Code Plus text book. All questions are multiple
choice, exactly from the book. Use the pre-study materials to help make
passing the exam on Sunday afternoon even easier! Your license could be
granted in just 72 hours.

Students receive the home study package, containing the Gordon West
Technician No-Code Plus text book, theory cassettes and computer program.
Included in the class fee are beverages, lunch (Saturday and Sunday), live
equipment demonstrations and free workshops after class on Saturday.

Other Technician No-Code classes:
Sunnyvale, CA: May 29, 30 & 31
Huntington Beach, CA: June 19 & 20 (Two days for kids)
San Fernando Valley, CA: June 26, 27 & 28
Alameda Mariners Class: July 24, 25 & 26

For more information, or to register for the class, please call Suzy West
at (714) 549-5000.

Weekend General Morse Code Class
--------------------------------
Date: Saturday 7th & Sunday 8th March
```

Are you a terminal Tech? Have you tried to pass the General class code test before, on your own? Have you "hit the wall" at 10 wpm, and need help over the plateau? The General class code weekend course is your answer to the Technician class blues. You will pass the General Class Code and Theory tests, in class, Sunday afternoon, while your spouse and friends pass the No-Code Technician exam in the next room!

Build your code speed, now, to 7-8 wpm with Gordon West's code tapes. This is the speed ticket for entry. We'll do the rest in class together, starting the morning of Saturday March 7th, 1998.

The exciting and entertaining course lasts two *full* days, and includes beverages and lunches, a Saturday night "Operating Session" with Gordon West and the No-Code Technician students, the Gordon West General Class Theory text book, and the 7-15 wpm code cassettes. If you have never copied code before, be sure to ask for the 0-5 wpm tapes too. Several General Class theory review sessions will be held throughout the weekend.

The only prerequisite for this class, is that you be able to copy 8 wpm by the start of class on Saturday.

Other General Code weekend classes:
Fry's Sunnyvale store: May 30 & 31
Fry's Woodland Hills store: June 27 & 28
Fry's Oregon store: August 1 & 2
Fry's Dallas, Texas store: Nov 7 & 8

For more information, or to register for the class, please call Suzy West at (714) 549-5000.

We hope you can make it to class.

So you want to re-live those old days when teleprinters were mechanical and every character that went out what typed by somebody on a real keyboard? Join us on Feb 20 for Green Key Night (& Day) to commemorate the opening of the HF bands to FSK RTTY, and to remember the pioneers. It's not a contest, no logs to send in, no scores to keep, and no rules. Just use a mechanical teleprinter if you can, use 850 shift now and then if you can, use vacuum tube gear if you can, but in any case get on the air and have fun and wallow in nostalgia. (I confess I'll be using a computer this year, as my old-gear station is all apart.)

Some people ask what frequency - well just anywhere that RTTYers hang out. Maybe 3620, 7090, 14090, 21090?

From: mdonohue@renc.igs.net
Message-ID: <34e57fce.2060470@news.igs.net>
Source record: 25528

Hi:
Just started to use the PK-232Mbx on the HF
side instead of just for VHF Packet. I now notice
that the TNC when having both radio ports (1,2)
hooked up to rigs that when I am using the TNC
for VHF Packet on Radio Port 1 will cause RF
to get into the HF Radio on Port 2 even though
on the TNC Radio Port 1 is selected. When I
disconnect the 5 pin connector for the HF Radio
from the back of the TNC the RF goes away.

Is their some signal still present on the unused
port that might be getting into the HF Rig, and why
would that pose a problem to my HF Rig (FT-1000D).

If anyone has any ideas or solutions I would be
greatly appreciated, as disconnecting the unused
cable is an inconvience.

I can't tell you about the Multicom software, but I have
something related to tell you. I have a 1278B without
the software.

You can make the FAX capability work without Multicom, and
it isn't very good. Only 16 gray levels. Much inferior to
good shareware like JVFAX. As for SSTV, I haven't met
anyone on the air who was using an MFJ for more than two
years. That says enough for me.

All the other functions seem to work fine with very simple
software. Most any modem program, YAPP, etc. do OK on
RTTY, Packet, etc. I prefer the simplest program for most
uses: the Terminal program that comes with Windows.

Mike. The push button switch on the PK232 leaks a little signal to the opposite channel. Normally the display will indicate some signal but not enough to cause the unit itself to decode. I would ignore it until it can be proven to be harmful. Cliff K7RR

A hint for all your folks who still use mechanical teleprinters...

WD-40 works very well as a rejuvenator for dried-out ribbons. The stuff evaporates quickly and the effect won't last for more than a few days, but you'll get nice dark printing for a short while.

Give the ribbons a good spray on Wednesday the 18th and be all ready for GreenKeys...

Me? I'll be banging away on 3585...

Any PDA with a serial RS-232 port will do. I use a Psion 3c.
I haven't seen any microcontroller-dumb-terminal yet, probably because
a screen is rather expensive...

==========================================================================

You really don't need a hard drive, tho it would handy. This old 8088
laptop with the 760 floppy drive of mine is enought to have Yapp and
all the needed dos files to be able use dos edit to precomose messages
and other stuff on it as well.

Well, I have never had my PK232 hooked up to a VHF, so I don't have personal experience with this problem, but you might re-evaluate your ground system and try toroid chokes on the radio cables. Another thing worth trying is adding or shortening to your HF cable by a couple of feet. Your cable might think it's an antenna.

Hi Julie

Have you priced used 386 notebooks lately? I bet you can find something for
under $400 and the machine will have lots of other uses too. A 386 has just
enough muscle to do a decent job on HF digital or image modes using the Hamcomm
interface, and you can always occupy yourself playing Wolfenstein 3D or
Whac-A-Mole, or do fairly serious word processing. No need to settle for a dumb
terminal when you can have a fairly smart one with a 70-100 Meg HD, a floppy
drive, and 4 megs of ram for less than a good palmtop. Check Computer Shopper
to see who has what for how much. I would post on an appropriate newsgroup
asking for reports on the company you pick before you give out your credit card
pr write that check, as these computer guys can sometimes be as slippery as
Hillary's husband, and so hard to corner that you would swear they have an oval
office too.

Hi
I have been an amateur since the mid 60's. I was around when ssb got it's real big entry into ham radio, when fm became the big thing, when repeaters became popular and when packet became popular. I have even been involved with the internet for about 2 years now.

But, I am trying to figure out which direction amateur radio is going. When i read the rec....misc ng most of the messages are concerned with the code discussion. I would like to get something more from this hobby.

A few months ago, I was on vhf packet and noticed that the number of packet messages seemed to be declining quite notiably.

Does anyone have any suggestions as to where our hobby is going. I know we are not going downhill. I think we are just in a technical slump.

I noticed with packet that a lot of the development/discussion work seemed to go underground because of the strong initial negative feelings about packet.

Anyways, where is amateur radio going. What new technology or use of a technology is being tried?

Its not a kit, unless you consider an external transverter to be a
kit.

See http://www.paccomm.com/ for further details.

I think many people would. That's one of the reasons there is so much discussion about Morse testing. It has become an anchor stone around the neck of amateur radio in this era of the internet and cellular phones. But there is a group of people who don't want amateur radio to go anywhere. They want it to stay just the way it is forever. Of course stagnant things are ultimately dead things, but they can't see that.

>A few months ago, I was on vhf packet and noticed that the number of
>packet messages seemed to be declining quite notiably.

That shouldn't be surprising. The technology has stagnated at 1970s levels for most amateurs. They're still trying to use Bell 202 over FM voice radios. That's so pitiful today in comparison to other available digital methods that it offers little of interest.

There are some people who are running 56 kbps networks, and some (mostly non-US) who are running at T1 rates. Now that's exciting. And activity levels on those networks are not declining because they can provide services equalling or exceeding those of the dial up ISP local loop, except untethered via wireless amateur radio links. And that means that amateurs don't have to take a back seat to the sorts of applications which are so enormously popular on the wired network.

The same apps can be used on the wireless amateur links too, and can be used free of the tether of the wired world. That means browsers, internet phone, streaming video, etc, all over amateur radio links with a snap and performance that puts most dial up services to shame. And of course, seamless internetworking with the wired networks is possible too, giving you the best of both worlds.

>Does anyone have any suggestions as to where our hobby is going. I
>know we are not going downhill. I think we are just in a technical
>slump.

I'm very much afraid we are going down hill, and rather rapidly too, as the bulk of the amateur population continues to age. There is a demographic crisis looming. Five of our six amateur classes average over 59 years of age, General averages 63. In twenty years, most of them will be SK, but upgrades beyond Tech are not happening at a sufficient pace to replace them. The influx of Techs has been welcome, but the traditional heart of amateur radio is facing a bleak future. Historically, most innovation, and most first adopter activity, is done by people under 30. That's true in society at large, and in amateur radio. But increasingly, amateur radio has disproportionately few people under 30. That bodes ill for the future.

The technology I mentioned above has been off the shelf for amateurs for 12 years now. Too few tradition bound amateurs have embraced it. Too few seem to even comprehend that it is available and that it offers such great potential to run exciting and innovative applications over amateur radio. The stock response when confronted with systems significantly faster than 1200 baud is "I can't type that fast." That shows that they have no comprehension of the value of a system which can perform beyond the keyboard chat level. And there aren't enough young amateurs, who haven't yet become hidebound (brainwashed/stagnated/calcified), to swing the balance.

In the 50s and early 60s when you and I became amateurs, most of us were teenagers or young adults. That's not true today. Most of those entering are older. And many of them aren't entering because they are excited by the technology the way we were. They are entering because they're looking for a cellphone substitute which avoids monthly charges, or they're entering to play radio games, or just to yak with friends and family. Nothing wrong with any of that, of course (except maybe the attempt to avoid common carrier charges), but it is a community which treats their radios like toasters, something to use, but not something to understand or explore or improve. (Cutting the green wire to get out of band Tx doesn't count as an improvement in my book.)

You and I were excited. We saw limitless possibilities. We fully expected things to change, and change for the better. We embraced change, welcomed and delighted in it. And at least some of us were determined to drive and lead it. That's largely lacking in the older group that amateur radio has become today. (Of course there are exceptions, some of them wonderfully exceptional, but too rare, far too rare, today.)

>I noticed with packet that a lot of the development/discussion work
>seemed to go underground because of the strong initial negative
>feelings about packet.

I don't think it has gone underground so much as that it simply hasn't fired the interest of the bulk of amateurs, even those running Bell 202 appliances. They don't understand the more modern techniques, and they can't see their uses and value. So they've just ignored the work which has been done by the few who do see the potential and the value of fast seamless networks and internets.

>Anyways, where is amateur radio going. What new technology or use of
>a technology is being tried?

As noted, we've been using 56 kbps digital radios for 12 years here in GRAPES, T1 digital radios form the backbone of the Slovenian network, TAPR is tinkering with 900 MHz spread spectrum radios, and a few folks have been applying DSP and superior modulation techniques to the problem of the HF channel. Any one of those things, if embraced on a wide scale, would be a revolution in amateur packet switched networking.

They've certainly had that effect among those who have embraced them. But the general run of amateurs can't seem to grasp the significance or value of such systems. They stagnate at 1200 baud Bell 202 pushed through a FM voice radio totally unsuited to digital operation, or worse, try to push 300 baud through a fading channel which is unsuited for more than 50 baud. (Note, baud != BPS, we *could* do 9.6kbps with 50 baud, if HF bandwidth regulations weren't so antiquated.) Stagnant things are ultimately dead things, and that's what amateur radio is becoming.

Now you wanted positive input, and I wish I could be more upbeat. The technologies are there, waiting to be used. The problems aren't technical anymore. The problems are social and political and demographic. And they'll have to be addressed on that level if amateur radio is to regain some vitality in the 21st century. Thus those code testing debates, which are of course social and political at base, may be the most important things happening in regard to amateur radio's future. We don't need a technical breakthrough, we have those in plenty. What we need is a social breakthrough which changes the amateur culture from one which has become more and more backwards looking to one that is forward looking.

Will the needed social and political changes occur before the demographic steamroller puts amateur radio out of its misery? I used to be confident that they would. I'm not so sure anymore.

It isn't a kit. And you don't need any test equipment at all. Once you choose the operating frequency from the EPROM (in the range 28 MHz to 30 MHz, selected via a front panel switch), you need to peak the RF coils. There is a self-test feature which allows you to do this using only the bargraph display on the front panel. That's the only adjustment you ever have to do to it.

This is a third generation design sold assembled by PacComm. It is frequency synthesized, packaged, and ready to use with the transverter of your choice. Microwave Modules and Down East Microwave transverters work well with it. Other transverters can be adapted to work with it. A straight through 15 pin cable connects it to a PI2 card which acts as the data pump. A Gracilis card works too. (PacComm sells the Gracilis cards, the PI2 is available from the Ottawa group.)

Generally, no. The Bell 202 modems don't detect or honor the 9.6 kb
modem signal, and in some cases vice versa. You need to wire up
RF carrier detect to make the two types of signals work on the same
frequency. It is still a bad idea, throughput of both sorts of signals suffer
when they are mixed. The optimum timing parameters conflict.

Does anyone have any knolage of the New RF ID transponders that are in use now??? I am trying to get some info on how they are used with no batteries inside. I think they use some sort of pulsed electromagnetic frequency to punp up a small capacitor and once the cap has enough energy, it sends a radio signal back to the reciever. Can anyone shed some light on this subject for me and let me know if I am right. I have been experimenting with some coils of magnet wire and a smmaller coil hooked to a capacitor and I just cant seem to transmitt much energy at any kind of distance. Im thinking that the system must be matched somehow at a resonant freq. so it can transmitt power more than a few centimeteres.
Please reply to ats@penet if you can help explain how to do this.

Thanks in advance!!!

Latest version of Morse Decoder MRP37[3] is officially released !

MRP37 is a software-based Morse decoder developed as an MS-DOS
application by Polar Electric Engineering. It uses the audio output of
your radio receiver connected to your computer's sound card to decode
the CW audio signal to ASCII text.
A comfortabe CW-send function is included!
Now you can have a QSO at CW speeds of 20 wpm or more and make even more
contacts during CW contests! And by careful listening, we think you'll
notice an improvement in your own code copying ability.

For more info and instant download and test of MRP37[3] go to
http://members.tripod.com/~PEeng/morse

For additional information send mailto: POLAR.Electric@cww.de

798. RTTY with Kenwood TS-850

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-16 00:00:00 UTC
From: khinceman@InfoAve.Net
Message-ID: <khinceman-ya02408000R1602981758280001@NNTP.InfoAve.Net>
Source record: 25564

I'm just getting started with RTTY using my Kenwood TS-850 and could use some help in understanding how to best use the IF Crystal filters.

I use this rig with an AEA PK-232 MBX, with connection to the Kenwood ACC-2 connector via an AEA cable. I use the LSB position for AFSK.

All works well, but I could use some filter help. I have both Kenwood 500 kHz CW Crystal Filters (455 kHz and 8830 kHz), and the 1.80 kHz SSB filter (8830 kHz).

I cannot seem to use the 500 kHz filters while using the LSB position, but they seem to work if I switch to FSK. I don't have things set up to transmit using FSK at present.

Why do they work in one position and not the other? I'm lost.

Any help would be most appreciated.

I have for sale a custom cable (AFSK/FSK/CW) from a KAM+ to a Kenwood TS-690S (or similar rig with the same pin-outs).

I will sell it for $30.00, including insured shipping.

It may sound a bit expensive - but they are tough to make.

Simple, and inexensive RF switches can be made with a cheap set of walkie talkies, (even toy walkie talkies), an old CB Radios from a pawn shop, or dusted of from the trunk or your car. There are a number of RF products that can be converted for this project, easier than making one from scratch.

Say you have a pair of old CBs, ideally two that run on small batteries, and at least one of them has a earphone jack, others can be used, but, the ready made phone jack, makes it so much easier.

A low power opto-isolator could be connected to the earphone jack, and the other end can be hooked up to an appropriate relay. when a loud or sharp sound is transmitted on the appropriate channel. The device hooked up to the isolator/relay, is fired. this works great for time lapse photography, firing a flash, or triggering an alarm. Circuits from a series of very simple, and low cost books by Forrest Mimms, found at Radio Shack will have tons of information, you might find handy.

You meet all kinds of nuts on the internet, I don't know if your one, if you plan on blowing up an abortion clinic with this switch, go ahead and use this method. If you want to use if for peaceful, persuits it should be fine too, be aware, that all types of wideband RF noise could trigger your switch, prematurly. Thats is why it is a great switch. for those "Army of God" types out there.

Hello all... I have a Kam plus and have it hooked up to my Icom hand held and an HF rig... Kenwood ts-570D. I can do packet on vhf with no problem. Also, on hf I can copy cw, ritty. But for the life of me I can not copy AMTOR! I have read the manual and just don't understand what I am doing wrong. Can anyone give me some suggestions as to what I might be doing wrong??? The signal I am listening to sounds like a cricket which, is what I am told, Amtor sounds like. when I find a signal I think is amtor I try the other modes to see if I can copy it with ritty or pactor and then amtor..... NO LUCK!

Hi Larry,

Thank God that drivel is confined mostly to the .misc newsgroup. I "unsubscribed" that group months ago because of that and other useless stuff on there.
>
>A few months ago, I was on vhf packet and noticed that the number of
>packet messages seemed to be declining quite notiably.

I have only been in the hobby this time around since July 1995, so I have very little history for comparison, but I found it difficult to find anything useful in the world of packet. I found that Pactor Mailbox was a good medium for those few instances where you could avail yourself of its capabilities. But how many people that you want to exchange mail with are on Pactor and not on the Internet?

>Does anyone have any suggestions as to where our hobby is going. I
>know we are not going downhill. I think we are just in a technical
>slump.

>I noticed with packet that a lot of the development/discussion work
>seemed to go underground because of the strong initial negative
>feelings about packet.

I thought the problems with packet were primarily political - i.e., the problems of being afraid that the FCC was going to shut you down because of something someone else does on your repeater.
>
>Anyways, where is amateur radio going. What new technology or use of
>a technology is being tried?

Here's my view of it. For an old guy, like myself, there just isn't any interest in the new (digital) modes, because it can't compete with either SSB ragchewing or chasing DX - neither of which seem to be big interests in digital modes. If I want to exchange technical

information I use the internet - just as we're doing now. I really like it better for that particular purpose, but it's no good for ragchewing or DX (where's the pileup?).

If the FCC would allow some HF Spread Spectrum without crippling restrictions, that would interest me. At least it has the potential for alleviating the crowding that is getting bad on the lower bands during the prime time hours.

So, if amateur radio is going to be heading anywhere other than into oblivion (as us old farts die off), then it's got to be the real young energetic guys who lead the way, and I really can't imagine where they would take it. I hear a lot of the younger hams on HF ssb talking about their computers and the internet and what you can do with all that. I have also experience traffic nets putting traffic on the internet to get rid of it.

I also see hams on the newsgroups showing great interest in the signal processing capabilities of the sound blaster cards. Boy, there is a technology that could explode. Can you imagine how much cheaper it is to do all of your (audio) signal processing with equipment that you already have on your PC instead of buying expensive add-ons like TimeWave or NIR-12 Dual DSP units? The IF DSP that is being made available in the newer rigs is just plain "out of sight" financially. That stuff would have to come way, way down in price before I would be interested in it.

I'm sorry to say it, Larry, but my considered opinion is that amateur radio, at least in the US, is going to become a political fatality.

805. FS: TI 320C5x DSKs (DSP Starter Kits)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-17 00:00:00 UTC
From: Randy Cole <cole@netcom.com>
Message-ID: <34E931F4.2EEB@netcom.com>
Source record: 25426

Some time ago I purchased a bunch of new, unopened TI 320C5x DSP Starter Kits (DSKs) that were sold as surplus by TI. The TI part number is TMDS3200051. I have five DSKs left, and I will sell these last ones for $50 each, including USPS Priority Mail shipping within the U.S.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K csamples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface. The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from TI. The URL is:

ftp://ftp.ti.com/mirrors/tms320bbs/c5xdskfiles/

The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC 780 ma supply with the right plug is available for $8.99 from Radio Shack (Part # 273-1630).

Price is firm, units are guaranteed against DOA. MO gets next-day shipment, personal checks OK but I may wait for them to clear. At this price UPS or USPS COD just isn't worth the hassle, but I'll ship FedEx COD if you want to pay the extra cost. Sorry, no non-US shipments.

If you want one send me a message and I'll reply with the information you need to order one.

Thanks,
Randy Cole
KN6W

Wrong. DesqView did do true multi-tasking, and did it quite well,
even on a 386SX with 2 megs of RAM. Other than the fact that DV
didn't handle graphics, it multi-tasked better than WIN31, in most
cases. I routinely ran three different comm programs simultaneously
on a 386. While it may be true that only one was active at any one
time, that's no different than what WIN95 does with programs which are
not written specifically for "true" multi-tasking.

>Windows 95, on the other hand, allows true, real time multi-tasking.
>For example, I can have a newsgroup reader running that is downloading
>newsgroup headers or message bodies or uploading e-mail while at the
>same time Internet Mail (part of IE3.02) can be uploading or

I did all that with DV years ago, except for the Internet part, which
I didn't have. I did do similar things with dial-up BBSs, however, at
the same time that several people were logged into my packet radio BBS
on the same machine at the same time, and I was using another serial
port to operate my own packet TNC on another band.

>downloading e-mail. Meanwhile, some other program, such as the Backup

DV would do it, but none of the backup programs would recommend it,
because they couldn't guarantee that you wouldn't lose information
while trying to back up an open file.

>Anyway, here's the bottom line. Even with the kind of trickery that

Cross-posted to: rec.radio.amateur,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.packet

I am interested in putting a station up on TCP/IP on one of my "spare" Macs (I have several older ones "laying around"). I have put a Mac Plus up on Net/Mac before. But I'm wondering about MkLinux. Is it possible to install MkLinux on a machine and just install extra drivers to run the extra TCP/IP for amateur radio? Are the Unix drivers for amateur radio compatible with MkLinux? Is there advantages of one over the other?

I'd be real interested in hearing about others experiences with getting Macs on TCP/IP.

Thanks,

If you must use the narrow filter, you need to use the IF SHIFT control to receive and transmit the high tones that the PK-232 uses. The PK uses 2295 and 2125 Hz audio tones, and the 500 Hz filter is probably centered around 750 Hz. Therefore the upper cutoff is at 1000 Hz. I use the CW filter on my TS-50S for RTTY and it works FB with the IF SHIFT turned up about 3/8 turn. That puts the center of the passband at round 2200 Hz. You will know you got it when you hear both tones with equal clarity and see the mark and space blips on the bar graph with equal intensity, at equal distances from their sides of the display.

If you are using LSB, set the narrow filter and listen to a strong RTTY or AMTOR or PACTOR signal. Slowly increase your frequency upward until you lose the SPACE tone. Adjust your IF SHIFT until you hear it again. Repeat until you have both tones solid on the bargraph. Make a mental not of where your IF SHIFT control is set, and next time start out with it set there. You will also have to fiddle with the THRESHOLD LEVEL control on the PK.

Before you start trying to transmit, you need to set the AFSK level on the back of the unit. Hook up a power meter between your rig and a dummy load. (Okay... I admit it... I have done this into an antenna but only on a dead band) Use your lowest power level that will give you a decent deflection on your meter.

Now, with the unit sending idle characters, adjust the AFSK LEVEL until you have the highest possoble power output. Turn it back down until you see a reduction in output. About 85 or 90 percent is great. Overmodulation is not the problem on AFSK that it is with fone, but it can be done. Also, if you want to run somewhat reduced power to compensate for the 100 % duty cycle of RTTY operation, you can adjust the AFSK so you have the output you want without having to jump all the way down to the next lower step if you don't have continuously variable output. Note that if you change the internal mic gain on your rig, you will have to re-adjust the AFSK LEVEL pot.

Hope this helps.

OK Glen,

I wouldn't argue at all with your observations and experiences. Many of the differences of opinion on the subject of multi-tasking are often due to different meanings attached to the terminology. For example, Data General, DEC, and others making minicomputers with real time multi-tasking operating systems couldn't agree with each other on the meanings of multi-tasking, real time, foreground/background, time-slicing, etc.

I was interested in the post that referenced the Caldera DOS - never heard of it. I may get a copy of DV out and load it up again and try it out. I never really did an evaluation of it under any kind of stress. Using programs like word processing and spreadsheets is not a test of anything other than task swapping ability.

Anyway, thanks for the additional education of RT OS's.

This depends on where you live. In the USA, I guess. Don't the
authorities publish license conditions, including ID requirements, in your
country? Over here, they do.

If your link layer is AX25, the callsign in that will suffice for ID.
If you're using some other sort of link layer without embedded
callsign, then you'll need a CW ID every 10 minutes.

Besides avoiding any collisions, once the user is in the 'connected-state'
the main advantage of the DAMA protocol is that it eliminates the problems
associated with simultaneous access to a node at different baud rates.
The user is operating in 'slave mode' i.e. he is always interrogated by the
DAMA master. Therefore, there is no requirement any more for cumbersome
multi-speed, multi-mode DCD electronics. It is being 'done by software'
in the node rather than in the user's TNC.
From the point of view of spectral efficiency, in my opinion, this is a
superior approach to wasting half of the bandwidth in an echo-duplex
channel.

This is not true of DESQview.
It is a fully preemptive multi-tasking OS, just like Unix.

> Windows 95, on the other hand, allows true, real time multi-tasking.

Fore sale...

Manufacturer
BK Precision

Model
830 Autorange Capacitance Meter

Price: $100.00

Description
4x6x1, accepts standard banana connector leads, have slotted contact for those tiny tine ceramic disc caps. Runs off batteries or wall adapter.

Auto range with LED range indicator, LCD display, have fold out legs for bench use.

History
Bought new back in 1989 when I was into high end car audio. Used for approximately 1 year tuning filters (part time on weekends, less than 30 hours total).
Cardboard box is wasted, and can't find meter leads (probably with my VOM), and the wall power adapter has been long gone(probably used for some other gadget).

If interested, please email me at the following

NOTE I hate spammers, so if replying, please remove the c from my name in the reply address.

Hobby Electronics is evolving just like the rest of the electronics industry.

My High School electronics course was the first year to switch to transistor radio as a construction project. Previous years used a tube radio. That was in 1969. That same school now builds a microcomputer project. There is no radio except in the text books. Radio in the 60's was exciting. We all listened to it, and 1969 was when FM commercial radio started taking off.

Radio was it, and SSB was not affordable by teens. FM radios for broadcast band, were just then becoming affordable, and even I finally replaced my Philips AM only radio. It was very exciting to youth; that was the only electronic recreation available at the time.

Hobby Electronics as far as Ham Radio is concerned, is still in the small projects. You cannot build a quality radio for less than a store-bought one, as you could 30 years ago. You can build small radios to enjoy the hobby, but you cannot compete in the HF bands. That's because many of the adult Hams on HF are running the legal limit and the bands have been wiped out now for over 10 years. I think the FCC radiation hazard agenda will finally end the era of kilowatt hamming. Teen Hams still enjoy building small CW rigs, and they still enjoy operating as a Ham, but they find it difficult to compete.

Where people get disgruntled is when they try coordinating things. Packet radio as a local LAN is easy and fun. It's when you try to network and cover several hundred miles, when it becomes a problem. That is when personalities clash. Political entrigue begins. That kind of packet radio is only enjoyable by the Type-A personality. How many Hams really care to packet a couple of hundred miles? What is at a hundred miles that you can't find locally?

I don't think packet is dying, it was never a mainstream part of ham radio. As total Ham population decreases, it is felt first in the fringe aspects of the hobby. Compared to ATV, packet radio is thriving, for example.

Focus on the core of the hobby (radio), and the rest doesn't really matter. If computers, internet, and radio are combined, the young Ham is highly interested. The world is rapidly headed for high speed networking as common as AM radio used to be.
Packet radio will be quaint in the world of 4 Mbps fiber for $30 a month, but radio and audio, for fun, will always be with us.
Hams are given excess spectrum. As television goes satellite

there will be huge spectrum opportunities below 1 GHz. Hopefully
we won't duplicate the obsolete band-plans there, and leave it
for SS.

That's as positive as I get :-)

I use my HP200LX palmtop. An HP100LX would work as well. They can be
found on the used market for $200.

Hi Julie,
For portable packet I use an old Radio Shack portable trs computer. It runs on AA cells that give lots of hours of operation. It has a built in terminal mode that lets you interface to the TNC without much trouble. The only drawback is that the screen is only 40 characters wide. But that does not seem to be too much of a problem for portable packet operation.

Using it, an HT, and a old TNC I made a portable packet station that fit in an old briefcase.

Source record: 25441

Hello,
My name is Dave and my call is WB4IUY. I'm working with WA4MJF, the sysop of the W4RAL BBS in trying to get the BBS restored to operation. Our local BBS has been running FBB dos ver 5.15c for a long time very nicely. Yesterday, our hard drive failed and we had to restore the system.

Here's the problem: We've reinstalled FBB dos ver 5.15 from 3 different sources, and get the same failure each time. The system will start up, everything looks normal, until it gets to the last screen where the bbs window usually pops up. It says "starting multitasking", the word "KERNAL" is in the upper left part of the screen, and it locks up...the hard drive keeps running and nothing else happens.

The computer is a 386 with 8 megs of RAM. Every thing about the machine checks out, plenty of free memory, etc. Again, we suspected a bad piece of soure code, so we've gotten the FBB from 3 different sites and they all do the same thing. Does anyone have any ideas?? We're working frantically to try and get the BBS back online, but nothing seems to work.

If you have any ideas, please send a mail to wa4mjf@juno.com because I'm sending this from my son's mailbox. Thanks you for any help you might have!

Dave WB4IUY

Hi Bruce. You still need a modem to decode the different digital signals. It connects to your audio output from the radio and connects to the serial port of your computer. Then you need a software package to run it. There is shareware software and software that come with some of the modems. MFJ makes an interface MFJ-1213 with software for $29.95. Check there web site at
http://www.mfjenterprises.com/mfj/compint/compint.html
I'm sure there must be other companies out there. I hope this helps you.

All packet modems have a terminal speed which is the speed the modem talks to
the computer at and the speed that the radio is using to talk with other modems
over the air. These are not the same. Usually the modem talks to the computer
at 4800 or 9600 baud. On packet, the radio operates at 1200 baud for VHF or
UHF and 300 baud on the HF bands to talk to the other radios.

It's a shame Dave that you represent a software company and don't appear to know what you are talking about. This doesn't say much for your software. You don't even know the difference between terminal speed and modem operating speed.Bob W7CTW

It could be that the FW inside the radio thinks that one would never listen to LSB with a 500HZ filter, so it never lets you engage it.

You ought to try hooking up for RTTY through FSK. THe 850 does a nice job in the FSK mode.

Just my opinion,

Jeff -- KD1IT/7

Caldera DR-DOS 7.02 has both task switching and multi-tasking options.
Source code for the kernel is also available. You can get it with or
without the Personal Netware drivers.

Check out www.caldera.com for more info. I downloaded it over the
weekend, but I have been using 7.01 for several months and am quite
happy with it.

Perhaps you didn't notice the program called DOSSHELL that came with the latest versions of MS-DOS prior to Windows 95 introduction. That program was a "task switcher" that allowed you to launch several programs and then switch between them in the same way that you switch between active programs in Window 3.1.

Quarterdeck had something similart that they had been marketing earlier than that - think it was called Desqview.

Unfortunately, neither those programs nor Windows 3.1 allowed true real time multi-tasking. In other words, only one program was really active at any time, and the other programs were essentially suspended. Windows 95, on the other hand, allows true, real time multi-tasking. For example, I can have a newsgroup reader running that is downloading newsgroup headers or message bodies or uploading e-mail while at the same time Internet Mail (part of IE3.02) can be uploading or downloading e-mail. Meanwhile, some other program, such as the Backup program, can be writing files to a backup device. I don't think Windows 3.1 was capable of actually doing all of that at the same time, but don't hold me to it. I didn't have an internet connection when I ran Win 3.1, so it may have had more capability than I realized.

Anyway, here's the bottom line. Even with the kind of trickery that DOSSHELL and Desqview were capable of, I don't think you can have true "dual windows", as you put it. At least not if you expect two windows to be separately updated in the sense of Windows 95. I think that's why Windows 95 is a truly, new solution.

There have been many schemes that performed pseudo-windows tricks in DOS that actually kept the video system in text mode - none of them ever got anywhere - maybe because they were too specialized. I have no recollection of any DOS program that ever put the video system in graphics mode except for WordPerfect5.1, which use graphics mode for its Print->View preview of the printed page. That was pretty slick stuff, but definitely single tasking.

Have you ever considered that perhaps you are beating a dead horse? There are some very interesting efforts at providing good shareware for the PackRat products and the Kantronics products. I won't try to

give you any of the Web Sites that I've referred to in the past, because I don't have any good record of them - but they are out there. Unfortunately, all of the seemingly good stuff is just demo or cripple-ware. They want some pretty good money for anything that's any good. Can't blame them. I do a little programming myself, and there is definitely a limit to how much I would want to do just for the love of it. Hi.

I am running the Kam Plus machine here in Windows 95 with the Kantronics Host Plus software. It does a decent job. Isn't there an equivalent S/W package for your 9612?

By the way, when you use the term "dual port" in your subject line and "dual windows" in your actual message, I assume that you mean that you refer to operating the TNC in the mode where it can have active comms going on with both its VHF and its HF ports and that the two windows would be dedicated one to each port. Host Plus does a pretty good job of that, but I don't make use of it.

Well, I've rambled on enough, so, good luck in your search.

What do you want it to DO? That, for a start, would let me choose an
appropriate waveband and power level. Without knowing that, there are
too many hundreds of possibilities.

The 850 was designed to do digital modes in FSK, not
LSB/AFSK as you are doing. The receive passband when the
rig is switched to FSK is optimized for RTTY and Pactor.
Since you have already got the ACC2 wired up, you have done
the nard part. Now all you need is an RCA connector between
the rig RTTY port and the TNC. Switch to FSK and you will
find that your 500Hz filter will work wonderfully on
digital, often making the difference between solid copy and
no copy at all. The 850 is a super digital rig when run in
this manner; it stacks up very well against any other rig.

The inability to use narrow filters in SSB modes is a shortcomming in most rigs.
FSK is the way to go for most digital modes but remember you can't do Pactor-II
or Clover in FSK mode.

There is very little AMTOR on the HF bands now. Most of the activity is
PACTOR. AMTOR mode B sounds like a fast RTTY signal. This is the mode
that hams use to send a cq. Once a station copies a cq they would switch
to AMTOR mode A which is the fast chirping sound you are hearing. PACTOR
which is the main mode used by hams now (besides RTTY) also sounds like a
fast RTTY signal when the station is calling cq. When two stations connect
it goes to a chirp mode
Which software are you using? I use Hostmaster which is made for the KAM.
There are allot of good s/w packages out there and I think most people are
using KAWIN that I have talked with

836. FULL INTERNET Access VIA Packet Radio??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-18 00:00:00 UTC
From: moss.i@virgin.net
Message-ID: <34eb0068.23239366@news.virgin.net>
Source record: 25454
Cross-posted to: uk.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

To all that can offer assistance

I believe there are things called packet radio internet gateways. What i want to do is to have FULL Internet access (not just EMAIL) through packet radio, via the said gateways so as to do away with my ISP which costs me £12/month, and the PHONE bill, which I think is a disgrace that we have to pay for. We pay for calls to the Internet in England!!!!!!

PLEASE NOTE:-If you have never heared of an packet radio internet gateway, DONT reply to me saying youve never heard of it, and its not possible, because I jolly well know it is possible, this would obviously be the first time you have heard of it, so DONT bother to reply to me. If you DO know what I am talking about, I would very much welcome your input.

I need to know what equiptment I will need to do this, the cost, and if there are local gateways operating in the MHZ freq. range that will be able to cope with a high speed packet radio modem (56K + baud), in the NorthWest region of England. From reading stuff off the net it wont cost a fortune to implement all this. I apparently need a TNC (Terminal Node controller), radio, amplifier, and Antenna, and anything else you might think I should need. Read some info about JNOS too, presume its possible to run TCP/IP over that, with WIN95, and all the traditional internet application programs running all above that, FTP, email, Netscape browser etc etc etc. I hope to run all that little lot from a 486AMD5x86-P75 ,256K cache,16MB, WIN95, which will more than meet the needs of the Packet radio interface.

If you can help would appreciate it

Cheers

Ian

You can download the TAPR TNC-2 manual, on which the MFJ manual is based,
from ftp.tapr.org in /tapr/software_lib/tnc/tncdocs.exe (self-extracting).

838. Need help on tuning AEA CP-100

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-18 00:00:00 UTC
From: KD1YV <jimkd1yv@snet.net>
Message-ID: <34EB1F11.DD35ADCF@ix.netcom.com>
Source record: 25456

I was digging through my Boxxe de Junque and decided to try out an AEA Computer Patch CP-100 that I was given. It came complete with a Commodore 64, cartridge software from AEASOFT called MBA-TOR, all cables, etc. I have the docs for the software, but not for the CP-100.

I had some success in receiving and decoding CW signals, though they weren't decoded extremely well.

Can anybody on the NG give me quick'n'dirty instructions on how to tune the unit, especially for RTTY signals? I'd appreciate a reply via e-mail as well, since my NG host "misses" a lot of postings. mailto:jimkd1yv@snet.net mailto:kd1yv@qsl.net mailto:jimkd1yv@ix.netcom.com

Thanks in advance,

>> >Im looking for for DOS software that supports dual windows for
>> >use with a Kantronics 9612 in terminal mode.

It seems that my question wasnt worded properly, thus, got side tracked into the 'multi-tasking' thread it has become. Let me see if I can ask my query more effectively...

Im looking for some packet software, that offers split windows (for use with a dual port TNC), than runs in DOS (6.22...not Windows).

I would prefere the TNC terminal mode...as opposed to the host mode that most Windows based split screen programs run in.

Thanks.

Only problem I see is your expectation of 56K access over the amateur VHF
bands with (ordinary?) radios. NOT easily possible, if at all. You'd need a
broad band type transmitter receiver (2) and that won't be as easily obtained.
Most high speed amateur user operations are at 9600 baud now... that's about
the limit of ordinary ham gear... and far too slow for regular internet web
access.

I have used that S/W with an AEA CP-1 which I assume is similar. All you do is tune the RTTY signal until the bar graph on the CP shows equal lights lit from both sides. Make sure you are using LSB on the radio. It should be decoding at that point.

I have a 1278 and use it with the Multicom for Windows software. It is
OK. It's main advantage is that mode changing is very easy (just click a
button) without having to remember the arcane mode commands. Wish it had
more "canned" messages (now linited to three per mode).

Yes , this a nice Methode ..
You have a AX25 Device , and you can work with more Software via
AX25 Device (TCPIP) to Packet

845. Re: Help with FBB, please...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-18 00:00:00 UTC
From: clarke@aztec.asu.edu
Message-ID: <6cfpvq$hfo@news.asu.edu>
Source record: 25463

----- snip -----

Here's the problem: We've reinstalled FBB dos ver 5.15 from 3 different sources, and get the same failure each time. The system will start up, everything looks normal, until it gets to the last screen where the bbs window usually pops up. It says "starting multitasking", the word "KERNAL" is in the upper left part of the screen, and it locks up...the hard drive keeps running and nothing else happens.

----- end snip -----

I can tell you what the problem is; but I don't know how to fix it!

Your system can't spell. The word is "Kernel". Spelling of such simple words is usually learned in the 3rd or 4th grades. If it hasn't learned that much, it certainly won't be able to handle the 100s of messages per day required of it.

I suggest you wrap it up and send it back to France.

:-)

Yes, to a search on the web for "US CODE" and find the subchapter and
notice how this adaptation can actually be used to do what it says! :)
although, good luck finding a valid email address to send the bill to, and
have fun convincing them not to laugh at you.... i got a couple guys
scared real good though, thought it was funny as hell! :)

849. Re: HELP AEA PK-88 PLUG

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-18 00:00:00 UTC
From: jrerlewe@mtu.edu
Message-ID: <6cfvmv$f0m$1@techsrv1.tech>
Source record: 25467

Here you are....

AEA PK-88
Looking at the back of the TNC, the center pin is number 8. The hump is at
the bottom of the plug. Starting from the hub, and going counterclockwise,
You hit pin 1, 2, 3, 4, 5, 6, and 7, and then the hump again.

Here are the pins and their function:
1 GROUND
2 TRANSMIT AUDIO
3 PTT
4 n/a
5 n/a
6 n/a
7 OPTIONAL SQUELCH SENSE (not normally used)
8 RECEIVE AUDIO

All you do is dig out your mobile radio's manual, and match up PTT,
GROUND, TX AUDIO, and RX AUDIO on both sides of the patch cable to the
pins on the connectors.

AEA has some of the better-written manuals i've seen for packet
products in a long time, probably because they were a good company that
didn't mind paying for good technical writers. It's easy to open other
manyals and find a heck of a lot more typos, broken english, and
nonsensical garbage. I suggest, by any means necessary, that you get a
copy.... lots of good information in it, and increases it's value as well!
:)
I only wish mine wasn't so dog-eared! I reference it so much, because i
take it from radio-to-radio so much, and change wiring, settings, jumpers,

I LOVE AEA!!! And I love Timewave for keeping them alive!
:)

852. DSP-232 to Kenwood TS-850 connections

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-18 00:00:00 UTC
From: Don Snodgrass <donsno@texas.net>
Message-ID: <6cgb37$ch9$1@news3.texas.net>
Source record: 25470

Hello...

I need help in properly connecting a DSP-232 to a Kenwood TS-850 for HF FSK.

Page A-10 of the DSP-232 operating manual figure 55 is the recommended hookup. However, I am confused by one particular point dealing with how to properly connect a shielded cable between the DSP's FSK/AUX receptacle pin 4 (FSK -R) and the TS-850's Input. First, I am not certain what is meant by input? I assume that is the rtty rca connector on the back of the Kenwood? Secondly, and more importantly, pin 4 equates to the green wire which according to figure 55 is to be connected to pin 3 of the ACC2 Connector. Do I connect the green wire to both pin 3 and the rtty connector on the back of the 850 and if so, how can I do this with a separate two wire shielded cable as shown on figure 55 as I see no place to connect such a cable with rca style connector to the rear of the DSP-232?

The Kenwood TS-850 manual is not of much help either and seems to imply that the shorting plug inserted in the rtty terminal is all that is needed?

Hope you will be able to help me. Perhaps you have an updated figure 55 sketch
that you could attach to an email response or fax to me at my work location.

Looking forward to hearing from you,

73
Don
KM5IC

p.s. I've been out of ham radio for two years and just getting back into the hobby. I recently purchased the DSP-232 from a ham who is upgrading to a DSP-2232. I am anxious to get on the air so hope someone can assist me.

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.swap

The Husky Amateur Radio Club is offering for sale 1 (one)
MFJ 1270B TNC-2. This TNC allows operation of both HF and VHF packet at
300baud and 1200baud.

Items included:
-power connector with molded attached cable (new)
-Manual.
-Fast-Start guide.
-Box

We are asking $60, OR BEST OFFER, for the unit. It is in fine working
order and has served us well for years. The only reason we are selling it
is that the 1270B has an internal delay in KISS mode only. So if you are
the SYSOP of a BBS that runs on your computer, it may be a slow TNC for
you. In normal packet operation it works fine. Only in the KISS mode does
it have this delay.

If you are interested, Please reply via email to jrerlewe@mtu.edu
or call (906)-487-4151 and ask for me, Joe.

Thanks, 73,
Joe N8OUZ

First of all, you got the name wrong. Packet radio internet gateway
has traditionally been a message/e-mail gateway only. On the packet
radio side it has traditionally been AX.25, and it routes messages
back and forth to the Internet. What you want is a TCP/IP connection
over packet radio. It has been done in various areas.

>PLEASE NOTE:-If you have never heared of an packet radio internet
>gateway, DONT reply to me saying youve never heard of it, and its not
>possible, because I jolly well know it is possible, this would

>reply to me. If you DO know what I am talking about, I would very much
>welcome your input.

Well, you don't get to say the term right, so some people might get
confused.

>I need to know what equiptment I will need to do this, the cost, and
>if there are local gateways operating in the MHZ freq. range that will

Again, you didn't get the term right. What you need is a UHF or
higher frequency if you want to operate on amateur radio bands. And
just to be sure, check with your own country's band plan as I am not
familiar with yours.

>be able to cope with a high speed packet radio modem (56K + baud),
>in the NorthWest region of England. From reading stuff off the net it
>wont cost a fortune to implement all this. I apparently need a TNC
>(Terminal Node controller), radio, amplifier, and Antenna, and

There are no off the shelf TNC which will give your 56kbps air speed
(or more). There are packet modems which are in use by various
people, but not with a TNC. An example is the WA4DSY "GRAPES" modem,

to be used by the P.I. synchronous I/O card by the Ottawa group. By the way, speed is measured by bps (bits per second), baud is not used commonly anymore as it refers to the change of phase per second, which does not correspond to the speed issue.

>anything else you might think I should need. Read some info about JNOS
>too, presume its possible to run TCP/IP over that, with WIN95, and all

>little lot from a 486AMD5x86-P75 ,256K cache,16MB, WIN95, which will
>more than meet the needs of the Packet radio interface.

Although JNOS might run under Windows, I am not aware of JNOS having a socket link or a network interface presence to Windows (95 or not). In order to use "traditional" internet apps, you need to use a stack which has connection with Windows networking interface. FlexNet is the only software I am aware of which can do that. However, I am not aware of FlexNet supporting the 56kbps GRAPES or any high speed packet modem (yet), although they have a modular design which gives it a future possibility. The only other way to do it, which is the way our club (University of British Columbia Amateur Radio Society) has been doing, is to use Linux operating system, which has AX.25 driver for the P.I. card for the 56k link, and run this computer as a gateway. Then use a Windows computer connecting to this Linux gateway via a network connection (we use 10B2 ethernet). But you didn't mention you have another computer, which this needs. I am not sure how crazy your local packet group is, but it took us a long time and quite some money to build the system we have today. In order to have the connection with the user, (we are only doing a short hop point to point now), we are currently building the 56k as a repeater to be put somewhere high up on mountains. Stilll people with no line of sight to these repeaters will not connect as any reflections will distort the signals badly.

I am not sure if you have your licence yet, but may be that will be a first step. Or may be now you think paying your ISP isn't that bad an idea.

The Radio Shack unit is identical to an Icom in that a "leaky" PTT
resistor of about 10k will cause it to transmit. Yaesu HTs using
the "leaky" PTT method require a resistor of 2.2k or lower to cause
them to transmit. So try using a lower value resistor in the PTT
circuit.

:Im looking for some packet software, that offers split windows (for use
with a
:dual port TNC), than runs in DOS (6.22...not Windows).

:I would prefere the TNC terminal mode...as opposed to the host mode that
:most Windows based split screen programs run in.

As I recall, your TNC is a Kpc-9612. You should be aware that all of the
Kantronics Dual-Port TNCs are "Dual-Port" ONLY when in Host Mode. In
Terminal Mode, the interface can address only one port at a time. 73,

Stan

865. AEA/Timewave DSP 232, DSP 2232

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-19 00:00:00 UTC
From: "Lab Assistant"
Message-ID: <34EC6DA5.1840@prism1.gatech1.edu1>
Source record: 25482

I want to get a multimode TNC. HF, Packet, Sats., etc.
Right now :) I the AEA DSP 232 or DSP 2232 seem to be the best.
Can anyone provide some comments about these models?
When I compare them with Kantronic models it seems that the Kantronics either have 9600 or HF. They don't seem to have a model that will do both.
I have been trying to dig out more complete information about the AEA models I but can't seem to find it. Especially a comparison between similar models and manufacturers.
What is are the differences between the DSP 232 and DSP 2232 besides the fact that the DSP 2232 is $100 more?
Do these TNCs have mailbox RAM?
What will effect of Timewave's buyout of AEA have on upgrades and so forth?
I have checked out some stuff on Dejanews but it was about 18 months old.
thanks!
Eddie, KS4TY

Hi Stan.

You are correct that my TNC is a 9612, and in terminal mode, the text
emulation to the screen has a numeric suffix (1 or 2) indicating which
port (radio) it originated from. I thought there may be some software
that could "monitor" that suffix, then direct it to its own screen.

Im a little confused to your statement that my TNC is "...dual port only in
host mode." Fact is, I *can* see, and control both ports at the same time in
terminal mode...perhaps Im missing your point...could you please clarify?

Thanks, & 73.

I think you're going to have to write your own. I haven't seen a program
designed to work this way for DOS. It is trivial to do it under Linux. Just
write a one liner shell script to Tee the stream from the TNC to a pair
of xterms filtered with sed to show only the lines with the proper stream
switch character prefix in each window. Filter the outputs of the xterms
to prepend the appropriate stream switch command to each line of
output and merge them back together to feed the TNC. (You could
probably hack something a bit cleverer out in perl, but this will work.)

Under DOS, you'd write a program with an endless task loop which
called the appropriate display window routine for each character received.
You'd need to maintain "state" to determine which window to use based on
the last seen stream switch character. (There are more elegant ways to do
this, but the brute force approach works, and is simple to code.) Handling
output is similar. Maintain "state" as to which window currently has the
keyboard focus, and prepend the appropriate stream switch command
to each line of output. (Use a pair of function keys to switch keyboard
focus from one window to the other.) Assuming you have a windowing
library for your compiler, this shouldn't take more than 50 lines of code
to implement.

But the technology is obsolete, as well as expensive. I mean by obsolete,
that it wastes bandwidth, and fosters political fights, where one group
must be the "haves" and another the "Have not's" as far as spectrum goes.
What happens to your 56k system when ATV pops up on the same freq? Who
wins? Who loses? Why should one group of Hams who are "there first"
preempt all other Hams? (the answer is everybody loses).

56k Spread Spectrum is the keyword. (or higher).

[snip]

The bandwidth is too large, the whole system depends on high central sites.
The large bandwidth isn't shared.

[snip]

> As noted, we've been using 56 kbps digital radios for 12 years here in GRAPES,

56k and T1 are analog modems. I call it the Foghorn technology. That is, the
spectrum is consumed wholesale, rather than shared. Spectrum problems is what
makes packet radio non-fun.

Steve

The Data Engine can. It can be fitted with 9600 baud and 300 baud modems.
But it is packet only, no TOR modes or RTTY.

>I have been trying to dig out more complete information about the AEA
>models I but can't seem to find it. Especially a comparison between

>forth?

Timewave's website says that they won't ship any DSP232 units until the
firmware bugs are fixed. They are shipping the DSP2232. So that sort
of narrows your choices unless you want to wait. For specs on the two
units, go to www.timewave.com and browse. The key difference is that
the 2232 can do simultaneous HF and VHF while the 232 can only do
one at a time. (And the 2232 actually works properly while the 232
currently doesn't.)

I'd add a bit of personal opinion here, I expect that the 232 will wind
up with more supported modes than the 2232 after the firmware is
sorted out. It is based on more modern, and more cost effective,
hardware. But the 2232 works right now, and supports the most
commonly used modes right now, including a number of satellite
modems.

872. Re: FULL INTERNET Access VIA Packet Radio??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-19 00:00:00 UTC
From: moss.i@virgin.net
Message-ID: <34ec8eb5.4754106@news.virgin.net>
Source record: 25489
Cross-posted to: uk.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Firstly I would Like to THANK DAVID TSE for his very informative and HELPFUL reponse to my intial posting, CHEERS DAVE, I will ask you a few things in a moment

Before then I would just like to respond to (I KNOW I SHOULDNT!!!! but I am going to) the other previous respondees, who were of absolute NO help, and I suggest have responded to these series of postings because they wanna flame!!!!! SIGH.

Why I want to connect to the net without an ISP, is to improve my connection speed (hopefully) have a closer more intermate internet connection to the NET than my ISP can provide (do away with firewalls etc BECAUSE I wanna experiment with net) and NOT have to pay the PHONE bill. The Americans dont pay for local calls to their ISPs, until that happens in UK, I want another way of connecting that doesnt invole a phone bill. If people wanna pay for their Internet connection, well I aint going stop them. But as for me I want to explore the various technological solutions to this problem, because a) its interesting, b) will save me money, and c) will provide an answer as to wheather its possible to implement realatively cheaply.

In response to WALT davidsons comment, I dont mind paying the ISP costs but the local phone call cost I do object to paying for. It goes against the very spirit of the Internet. In America they can leave their computers connected to the net 24hours a day 365 days a year presumably, and all they pay is the ISP. Well thats What I want too over here.
Further while ever there are people like you Walt, who are happy to go along with the main stream, progress will be slow. The Innovators through history have always been the people who have not been satisfied with the way things are.
I have even considered a small cheap two way SAT link to the NET. Apparently Bill gates has one up on me on this one, apparently he intends to implement a SAT system which would enable anyone with a 2 way sat link, (which units i think he is going to develope which will be very cheap), to link to the NET.
I too think for better communications, much improved speeds and services, it would be better to connect to the NET NOT via a modem and PHONE line, and to dispense with that archic part of the link altogther. So I am not the only one who thinks the modem phone link is a bad idea.

Right so having outlined my reasons for wanting a different way of connecting to the NET I will now go on to respond to the points made

by David Tse

>There are no off the shelf TNC which will give your 56kbps air speed
>(or more). There are packet modems which are in use by various
>people, but not with a TNC. An example is the WA4DSY "GRAPES" modem,
>to be used by the P.I. synchronous I/O card by the Ottawa group. By
>the way, speed is measured by bps (bits per second), baud is not used
>commonly anymore as it refers to the change of phase per second, which
>does not correspond to the speed issue.

I Dont mind having to implement the link David by I/O card, and modem, infact this was the initial way I invisioned it to be done. I just read somthing about a TNC. I presume then David if It were possible to implement the link via Single PC (by the Way I have some 386s hanging around doing nothing) I would need the following??

PC--i/o card--Modem--Radio--Amp--Antenn

Then the software that would implement the TCP/IP levels and communicate with the tradional Internet Application Progs would be the Flexnet software you mention below, is this a commercial piece of software?

>Although JNOS might run under Windows, I am not aware of JNOS having a
>socket link or a network interface presence to Windows (95 or not).
>In order to use "traditional" internet apps, you need to use a stack
>which has connection with Windows networking interface. FlexNet is
>the only software I am aware of which can do that. However, I am not
>aware of FlexNet supporting the 56kbps GRAPES or any high speed packet
>modem (yet), although they have a modular design which gives it a
>future possibility.

> In order to have the connection
>with the user, (we are only doing a short hop point to point now), we
>are currently building the 56k as a repeater to be put somewhere high
>up on mountains. Stilll people with no line of sight to these
>repeaters will not connect as any reflections will distort the signals
>badly.
>
Whats the max. range (in miles) of line of sight comms so as to implement a 56K connection for eg?

From your posting David then, I take it that full internet connection with all the traditional internet programs is possible to implement and that what I wish to atchieve is possible.

The implemtation of a Gateway you mentioned 56K wirth ethernet link is interesting way to do it, and as you pointed out may be the only way possible with speeds of 56K and above. But Hopefully my research will determine wheather it will be possible to implement a stand alone PC connected to modem and radio as outlined above for 56K and above.

Any Idea of costs involved David

Cheers

Ian

Firstly I would Like to THANK DAVID TSE for his very informative and HELPFUL reponse to my intial posting, CHEERS DAVE, I will ask you a few things in a moment

Before then I would just like to respond to (I KNOW I SHOULDNT!!!! but I am going to) the other previous respondees, who were of absolute NO help, and I suggest have responded to these series of postings because they wanna flame!!!!! SIGH.

Why I want to connect to the net without an ISP, is to improve my connection speed (hopefully) have a closer more intermate internet connection to the NET than my ISP can provide (do away with firewalls etc BECAUSE I wanna experiment with net) and NOT have to pay the PHONE bill. The Americans dont pay for local calls to their ISPs, until that happens in UK, I want another way of connecting that doesnt invole a phone bill. If people wanna pay for their Internet connection, well I aint going stop them. But as for me I want to explore the various technological solutions to this problem, because a) its interesting, b) will save me money, and c) will provide an answer as to wheather its possible to implement realatively cheaply.

In response to WALT davidsons comment, I dont mind paying the ISP costs but the local phone call cost I do object to paying for. It goes against the very spirit of the Internet. In America they can leave their computers connected to the net 24hours a day 365 days a year presumably, and all they pay is the ISP. Well thats What I want too over here.
Further while ever there are people like you Walt, who are happy to go along with the main stream, progress will be slow. The Innovators through history have always been the people who have not been satisfied with the way things are.
I have even considered a small cheap two way SAT link to the NET. Apparently Bill gates has one up on me on this one, apparently he intends to implement a SAT system which would enable anyone with a 2 way sat link, (which units i think he is going to develope which will be very cheap), to link to the NET.
I too think for better communications, much improved speeds and services, it would be better to connect to the NET NOT via a modem and PHONE line, and to dispense with that archic part of the link altogther. So I am not the only one who thinks the modem phone link is a bad idea.

Right so having outlined my reasons for wanting a different way of connecting to the NET I will now go on to respond to the points made

by David Tse

>There are no off the shelf TNC which will give your 56kbps air speed
>(or more). There are packet modems which are in use by various
>people, but not with a TNC. An example is the WA4DSY "GRAPES" modem,
>to be used by the P.I. synchronous I/O card by the Ottawa group. By
>the way, speed is measured by bps (bits per second), baud is not used
>commonly anymore as it refers to the change of phase per second, which
>does not correspond to the speed issue.

I Dont mind having to implement the link David by I/O card, and modem, infact this was the initial way I invisioned it to be done. I just read somthing about a TNC. I presume then David if It were possible to implement the link via Single PC (by the Way I have some 386s hanging around doing nothing) I would need the following??

PC--i/o card--Modem--Radio--Amp--Antenn

Then the software that would implement the TCP/IP levels and communicate with the tradional Internet Application Progs would be the Flexnet software you mention below, is this a commercial piece of software?

>Although JNOS might run under Windows, I am not aware of JNOS having a
>socket link or a network interface presence to Windows (95 or not).
>In order to use "traditional" internet apps, you need to use a stack
>which has connection with Windows networking interface. FlexNet is
>the only software I am aware of which can do that. However, I am not
>aware of FlexNet supporting the 56kbps GRAPES or any high speed packet
>modem (yet), although they have a modular design which gives it a
>future possibility.

> In order to have the connection
>with the user, (we are only doing a short hop point to point now), we
>are currently building the 56k as a repeater to be put somewhere high
>up on mountains. Stilll people with no line of sight to these
>repeaters will not connect as any reflections will distort the signals
>badly.
>
Whats the max. range (in miles) of line of sight comms so as to implement a 56K connection for eg?

From your posting David then, I take it that full internet connection with all the traditional internet programs is possible to implement and that what I wish to atchieve is possible.

The implemtation of a Gateway you mentioned 56K wirth ethernet link is interesting way to do it, and as you pointed out may be the only way possible with speeds of 56K and above. But Hopefully my research will determine wheather it will be possible to implement a stand alone PC connected to modem and radio as outlined above for 56K and above.

Any Idea of costs involved David

Cheers

Ian

This might mean that it has a version of KISS which resets the parameters
to the defaults after a while with no packets coming in and the defaults
aren't optimized for your operation.

Upgrading to TAPR 1.1.8a or 1.1.9, or using a KISS-only eprom will fix the
problem.

So you want to re-live those old days when teleprinters were mechanical and every character that went out what typed by somebody on a real keyboard? Join us on Feb 20 for Green Key Night (& Day) to commemorate the opening of the HF bands to FSK RTTY, and to remember the pioneers. It's not a contest, no logs to send in, no scores to keep, and no rules. Just use a mechanical teleprinter if you can, use 850 shift now and then if you can, use vacuum tube gear if you can, but in any case get on the air and have fun and wallow in nostalgia. (I confess I'll be using a computer this year, as my old-gear station is all apart.) Suggested frequencies are wherever the Baudot operators hang out, maybe 3620, 7090, 14090, 21090.

These high speed links are normally on a point-to-point basis, not for general user access, normally for mail links etc. I think they are normally on the microwave bands, probably 10GHz.

Normal BBS/node access is 1200baud or 9600baud. Don't forget that is the maximum uninterrupted data transmission rate - the actual throughput is dramatically reduced when the data is packeted (if that's a word?) and after collisions with other stations' transmissions. As an indicator 1200bd will facilitate a data transfer of 60 bytes/sec on a reasonably clear channel.

Even if you can get a 56k user access to a node don't forget that node won't be the gateway to the 'net. The TCP/IP routing will go through a number of other nodes which could be any bandwidth you care to think of.. and yours won't be the only TCP/IP traffic.

..Then don't forget BR68 1(7) and the other sections regarding message content.

Get an ISP with a local call number, put that in Friends & Family (if you're on BT) and save the surfing for the weekends. Then it's only 0.9p / minute.

(or alternatively you could work for a company with an internet-enabled network and RemoteAccess with dial back :o))

A 56K packet link should be able to replace a phone line for local communications. If you happen to own your own ISP, this could allow you to have Internet access at home without paying phone charges.

The problem for most people is: what's on the other end of the radio link? It's probably another computer, and *it* still needs at least a 56K connection to the Internet at large. How will you provide this connection? If you have your own ISP with its own T1 connection, you just run a wire from the machine at the far end of the radio link into your main router. But if you are using a commercial ISP, you have to convince *them* to provide your far-end computer with a connection. And you probably have to provide both ends of the radio link yourself.

At the UBC amateur radio society, we have a couple of machines with full Internet access provided entirely by radio. There is one 56 kbps radio link, and another 2 Mbps link. But the "far end" of the one link is a machine in the electrical engineering building, and the "far end" of the other link is a machine in the student society offices. These machines, in turn, are connected to Ethernet or better networks that cover the campus, and have a pipe to the outside world that is at least 10 Mbps. So the radio links "extend" the campus network into machines that are not otherwise connected. But without the physical network links (copper and fiber) that covers the campus, there would be nobody for the radio-linked machines to talk to other than themselves.

Dave

P.S. I trimmed the list of newsgroups to ones that seemed at least somewhat relevant to the subject. Spamming your message to every newsgroup with "radio" in the name just means you're too lazy to figure out where your question really belongs.

Hello Bob, the problem is that the person who posted the query in the UK. Internet Gateways (and phone patches) are ILLEGAL under the UK license conditions, and with a few rare exceptions the UK packet network still mainly runs at 1200, with occasional 9600 ports, plus the odd once-in-a blue-moon high speed microwave band port. The information that he has been given is correct, specifically for the UK.

Regards, Graham Galbraith M0ADR

Can anybody help me to set up my win95 pc to work with the flexnet tcp/ip addon software that adds a virtual adapter under the network setup to pass tcp/ip data to ax25 ?

The flexnet win95 software works ok on my system with a baycom USCC card, so I'm sure the hardware's ok.

What I need to know is what to put in the tcp/ip settings window when installing the virtual network adapter. What should go in the IP routes setup on the flexnet control panel?

Could someone who has got flexnet tcp/ip on win95 working, let me know their set up, or what settings they have used as i'm sure its just a case of configuration.

Any help will be most welcome.

Hello!

I have a little problem. My Hamcomm doesn't work on my Pentium 150 MHz. It just receives a 500Hz tone on the F7 screen and that's all. I have checked many times that the modem is correctly made... And it sends RTTY just fine. The same modem worked fine in my laptop 286.

A friend of mine told that it might have something to with FIFO in the COM port I use. What should I do to get it working again?

Chris G. wrote in message ...

:You are correct that my TNC is a 9612, and in terminal mode, the text
:emulation to the screen has a numeric suffix (1 or 2) indicating which
:port (radio) it originated from. I thought there may be some software
:that could "monitor" that suffix, then direct it to its own screen.
:
:Im a little confused to your statement that my TNC is "...dual port only in
:host mode." Fact is, I *can* see, and control both ports at the same time
in
:terminal mode...perhaps Im missing your point...could you please clarify?

I'm much more familiar with the Kam dual port, but if the Kpc-9612 is
similar, when in Terminal mode you must "switch" ports, rather than see data
from both ports simultaneously.

In Host mode all of the data from both ports - and all streams - is
delivered to the "Host" computer as Host mode packets which include a header
with all the information that a Host mode program, like KaWin, needs to
parse the data packet to the appropriate on screen window.

Will White wrote:
>
> Is this true? Is it enforceable?

Yes, it is:

United States Code Title 47 section 227 (a)(2) defines:

The term "telephone facsimile machine" means equipment which has the capacity (A) to transcribe text or images, or both, from paper into an electronic signal and to transmit that signal over a regular telephone line, or (B) to transcribe text or images (or both) from an electronic signal received over a regular telephone line onto paper.

USC 47 227 (a)(3) defines:

The term "telephone solicitation" means the initiation of a telephone call or message for the purpose of encouraging the purchase or rental of, or investment in, property, goods, or services, which is transmitted to any person, but such term does not include a call or message (A) to any person with that person's prior express invitation or permission, (B) to any person with whom the caller has an established business relationship, or (C) by a tax exempt nonprofit organization.

USC 47 227 (a)(4) defines:

The term "unsolicited advertisement" means any material advertising the commercial availability or quality of any property, goods, or services which is transmitted to any person without that person's prior express invitation or permission.

USC 47 227 (d)(1)(B) makes it unlawful:

"to use a computer or other electronic device to send any message via a telephone facsimile machine unless such person clearly marks, in a margin at the top or bottom of each transmitted page of the message or on the first page of the transmission, the date and time it is sent and an identification of the business, other entity, or individual sending the message and the telephone number of the sending machine or of such

business, other entity, or individual."

USC 47 sec 227 (b)(1)(C) makes it unlawful:

"to use any telephone facsimile machine, computer, or other device to send an unsolicited advertisement to a telephone facsimile machine.☐

USC 47 sec 227 (c)(5) also states:

"A person who has received more than one telephone call within any 12-month period by or on behalf of the same entity in violation of the regulations prescribed under this subsection may, if otherwise permitted by the laws or rules of court of a State bring in an appropriate court of that State:

(A) an action based on a violation of the regulations prescribed under this subsection to enjoin such violation,

(B) an action to recover for actual monetary loss from such a violation, or to receive up to $500 in damages for each such violation, whichever is greater, or

(C) both such actions. It shall be an affirmative defense in any action brought under this paragraph that the defendant has established and implemented, with due care, reasonable practices and procedures to effectively prevent telephone solicitations in violation of the regulations prescribed under this subsection.

If the court finds that the defendant willfully or knowingly violated the regulations prescribed under this subsection, the court may, in its discretion, increase the amount of the award to an mount equal to not more than 3 times the amount available under subparagraph (B) of this paragraph."

BTW, in the case of Destination Ventures vs. FCC (46 F.3d 54, 1995), the 9th Circuit Court upheld the legal ban on unsolicited fax advertisements as constitutional, as it unfairly shifts costs to the recipient.

Every day, people are suing the spammers -- and winning. But the real trick is to go after the ISP's. They always have a clause in their client agreements which forbids sending unsolicited Email. You don't have to stop the spammers, the ISP's will. If they don't, they're also liable.

I have a Bay Pac-2 with a cable made for the FT-50 R
I used it with an HP-200 Palmtop! Talk about small!!!

It works and I would like to sell the BP-2 and cable for the FT-50R

Make me an offer!

Hi, Jani. I had the same results when I upgraded to a Pentium 100. You will get better results if you do not try to use the DTR and RTS lines for power. Disconnect them from the Op Amp and use them only for PTT and CW keying. I use two transformers for power, with their primaries in parallel and secondaries rectified, filtered, and connected in series with the connection between them tied to ground. This gives me + and - 12VDC (actually close to 18VDC) to power the chip. This gives me a nice high output voltage sufficient to impress the DSR line. With external power, you get rid of the 4 diodes and 2 filter caps in the standard circuit.

Another trick that sometimes works is to quickly toggle TX on and off. Sometimes this kick-starts the system into functioning.

For safety, use an IC regulator for both voltages. Start out with 12 volts and increase until you get satisfactor operation.

Hamcomm defintely worked better on older machines, but it can still be made to run on the new stuff. Eventually, though, you will probably have to move up to a proper modem circuit for i/o, or use a sound card. It may well be that Hamcomm's effectiveness ends with mid-range Pentiums. This is a shame, because I really like the setup and was looking forward to seeing a PACTOR version. Meanwhile, enjoy.

You might also try connecting enough dry cells in series and center tapping the battery to ground, giving you again bot + and - voltages. Used to be, you could use 9V batteries, two of them in series and center-tapped, but that doesn't seem to be hot enough for these new serial ports.

Don't be so quick to go after the ISP's. One of my clients is an isp
located in the boston area. they have had to waste hundreds of man
hours going after spammers in the past 6 months and they, like all ISPs,
are loosing the battle.

why is this so? Two reasons; both based on different failings of the
current email infrastructure. first is the cost of email put on the
recipent. second is that email filtering is trivial to bypass.

the only solution to spam is to push the cost of email back onto the
sender. yup, this means postage. fortunately, using financial
cryptography, is possible to issue postage without needing a central
authority. It is also possible to issue different classes of
postage for friends and mailing lists vrs strangers.

one slick things about self issued postage is that you get to collect
the money. one of the bummers about self issued postage is that
others will want to get a cut of that money. I can see a future where
mail servers bid to carry your mail for a fee or percentage and you
get to choose one based on price and quality of service.

Paul,

I'm using my BP-2M with my FT 50... ran into a couple of problems..but nothing that can't be overcome. The first was the plug... I made my own for about $1.00. Works great!

The second, was RF locking the radio up in transmit. If you use the radio without and external antenna... you're going to have the same problem. The solution is to get a snap on ferrite chokes like the ones sold at the rat-shack. If you'll snap it on... right up close to the radio (at the mic connection), you'll be able to run full power with your rubberduck. If you're going to be using an external antenna... no problem. Tiz an excellent portable setup!

It's hard to find a major ISP in the States that doesn't support unlimited connect time for a flat rate these days. This includes some of the "big ones" with millions of subscribers. Whether this pricing model is going to be viable in the long run is a matter of some debate, but the trend has been clear for quite awhile now.

Local telephone companies don't care if you camp out on the line 24 hours a day, as long as you pay the US $20/month service charge. (This is true of both basic and ISDN service in my area, although roosting on an ISDN account will quickly send you to the poorhouse in ISP charges.)

It's safe to say that "free" local calls are subsidized by long-distance rates to some extent, although to be honest the average US citizen has little grounds for complaint about high long-distance rates either.

IMHO the U.K. and Europe have always been behind the times in matters technological. Heck, I've been involved with personal-computer software projects that had to support cassette tape drives as late as 1988, just for the European market. Get with the program, you guys! :)

> think is amtor I try the other modes to see if I can copy it with ritty
> or pactor and then amtor..... NO LUCK!

Here are a few suggestions:

1) You should be listening in LSB mode.
2) To copy AMTOR, you need to place the TNC in the LAMTOR mode (Listen AMTOR).
3) Make sure there is enough audio getting to the TNC to properly lock to the signal.
4) You might be hearing the "ack" chirps better than the data chirps -- they are shorter and carry no
printable information.
5) Tuning is pretty critical.

Good luck!

Hi All

I would like to get onto 9k6 packet operation, the equipment I am using on
2400 baud is a tiny2mk2 and a kenwood th78e, both work great.

I need to mod the kenwood for 9k6 or I have a pye PFX 2mtr synthesised
hendheld if anyone knows how to do that.

The tnc I think will do 9k6 just by moving the jumpers inside the front panel
if not
will I need to splash out on another tnc?

Any help or infomation will be most welcome .... Paul G7SYK@GB7WNM

What I'm curious about is what the UK third-party traffic rules have to say about this. This sort of use is clearly beyond the scope of "transmissions of a technical nature whose importance does not justify the use of the public telecommunications infrastructure" (paraphrase of the Canadian regulations). What you propose would certainly be illegal in Canada.

Gee Walt,
My TV works great in fact I have five of them, and I dont have to pay a license for any of them. Nor do I pay any licenses for any of the number of ham radios, fm/stereos, portable boom boxes etc etc.

I have a 44,000bps connect on a second phone line for 16.00 a month.

All my cars have been lead free for years and my gas is $0.82 a gallon, It costs me 5.00 a year to have it inspected.
I see all these posts from people wanting someone to look something up for them, I just thought they were too lazy or stupid too use a search engine. I gess they just cant afford all the socialistic benefits they have.

As far as pollution goes I think your one wallbanger thats full of it.

>Packet radio interface.

First, all the packet gateways I know about are Amateur Radio packet
gateways, so to gain access, you will need an Amateur Radio license.
Second, not all the traffic carried on the Internet is permissible under
an Amateur Radio license in many countries, including, I think, the UK.

A group of BC Amateurs has designed and built a 56 K radio/modem currently
used to connect a number of sites together, including a link to the
Internet. I understand they're presently designing a new one that will
basically have two connections plus power - an ethernet connector and an
antenna connection.

They're presently using the 430-440 MHz band with about 85-100 KHz
bandwidth, although the goal down the road is to go up in frequency to

just under 6 GHz so that the bandwidth for a T1 connection will be available.

So, in conclusion, if I were you, I'd find a knowledgable person at the RSGB who can tell you what is possible under UK rules. They would also be able to steer you to active packet people in the UK.

Hi, "newbie" --

It sounds like you may be new to the "newsgroup thing," and aren't yet conversant with the subject of spambots. Spambots are automated newsgroup posters which place messages such as the ones you've replied to on literally tens of thousands of newsgroups, without any intervention or supervision from the people responsible for the spam.

Replying to spam messages in newsgroups does nothing but compound the waste of bandwidth and server space caused by the spam in the first place. The originators of the spam do not look in the thousands of individual newsgroups for any replies to their spam, and will thus never see your indignant reply... but the rest of us have no choice.

Further, many of us use news servers such as Super Zippo (http://www.zippo.com) which implement automatic spam filtering based on a wide variety of criteria. The idea to keep messages with subject lines or contents like "MAKE MONEY FA$T", and so on from ever appearing in their customers' view of the newsgroups. This technology works very well, and is a major selling point for the news services that offer it. Unfortunately, when someone like yourself replies to a spam post that is visible on *your* news server, your reply has the effect of making the spam visible to the rest of us for the first time -- effectively generating spam we otherwise would never have seen in the first place. This happens because many of the common spam filters don't reject replies, only original messages.

So in short, please knock off the replies to spammers. Your audience for such replies is limited to everybody in the world *except* the spammers themselves, and believe me, everybody else already agrees with you.

Well, not exactly the poor house, but unlimited ISDN here in St. Louis
would cost about $250 a month. That's a 2B+D line ($100) and ISP
charges ($150).

Ian,

I've been researching what it would take to implement a high-speed amateur packet Internet digipeater here in St. Louis. There's lot of problems, like restrictions against commerce on the Ham bands, restrictons against sending encrypted files, other folks reading your emails, etc.

Fortunately, I have a friend who runs a small ISP, and is willing to set up a digipeater in the non-licensed 900 MHz ISM (Industial/Scientific/Medical) band. His ISP only has an 128 Kbps ISDN connection to the net, so we're probably going to use 115 Kbps data radios, which are relatively inexpensive and run about 4 watts. His end will use an omnidirectional antenna, while my end will use a high gain yagi.

For instance, this is just one company that provides such equipment:

http://www.utilicom.com

Cheers!

Looking for information on the AEA PK232MXB. Just bough one from an estate sale. (no manual in the deal). I have been making some assumptions, but want to confirm before connecting to the rig.

1. Is the jumper on the bottom for keying polarity? If so, which is positive and which is negative keying? If not where is the keying jumper and the correct positions?

2. What is the proper battery for replacing the one in the unit? (soldered in)

3. Does anyone know where I can get a tech manual or operational manual? (prefer cheap).

I am trying to hook it to my TS450 Kenwood. Thanks and 73's.

I personnaly made a home built "Baycom" packet modem and try it with my FT-50 RD with "WINTNC" program for windows it's simple to use and simulate a complete tnc. The only problem is to fit the special connector. Making the plug was the complicate part of the project because i made it my self with and 1/16" and 1/8" mono jack molded in epoxy. Wintnc run on windows 3.1

Not really. I've been following the subject pretty closely, and, while
the cites you provided are certainly used in regards to "traditional"
fax machines, they have not yet been successfully used in a situation where
a consumer received junk mail from an e-mail spammer. The few cases in which
it has been tried, the strategy failed.

The cases where spammers have been sued sucessfully have been typically
using "Denial of Service" and "Dilution of trademark" complaints.

If you have any verifiable cites to the contrary I'd love to hear about
them.

That is not all correct.

Under the current rules, if you publish your protocol (i.e. GTOR, PACTOR, etc) then you can ID in the data stream. These are considered to be extensions under the other data formats that was added several years ago.

The standard has been to publish it in the ARRL and TAPR Digital Communications Conference Proceedings.

So, if you develop your own data link layer, just publish what it is and you are okay.

Paul, you'll need a daughter card G3RUH modem fitted to the Tiny 2
modem disconnect header to allow it to do 9.6 kb (I think PacComm
calls it a NB-96). The on board modem only supports 1200 baud and
300 baud. The jumper changes the *PAD* speed, but 9.6 kb uses a
different modulation and has to have the modem hardware changed
out too.

I sincerely doubt you'll be able to make either of those synthesized
HTs transmit 9.6 kb properly. The PLL's loop filter will distort the
modulation. This is a problem shared by practically all FM radios
which inject modulation into the PLL's loop. TR is also pretty slow
on most HTs, and that's a problem at 9.6 kb too (and it would get
intolerably slow if you tried to fix the PLL time constant to allow it
to pass 9.6 kb). You should be able to get them to *receive* Ok,
however, if you tap directly off the discriminator.

The better solution for 9.6 kb is a crystal controlled radio with
varactor modulator. The little TEKK KS900 works great, cheap
too. Most older land mobile gear works too, though you may
have to open up the IF filtering a bit on some of them to get
undistorted receive.

FS/FT: Commercial 5GHz Digital Microwave radios

I have nice pair of commercial spread spectrum digital microwave radios.
They are made by CYLINK, model FT1, with the following major specs:

Frequency 5725 to 5850 GHz (cover ham band)
Freq step 5 to 10 MHz
System Gain 110 dB
Tx Output power 30.5 dBm Min
Rx Noise Figure 5.5 dB Max
RF interface N Connector
Voltage 110 V
Dimensions 5.25 x 17 x 15 in
Weight 39 lb.

These were pulled from service, only few years old, in excellent
shape, with manual.

Use for a commercial microwave link project, or for ham use
on the 5.650 - 5.925 GHz ham band.

These new sell for over $8K each, will sell or trade to best
reasonable offer.

Thank you for the reply. I did visit your site and found some useful links, but there doesn't seem to be a lot of info on TCP/IP for ham radio on any of the links I explored.

Can you tell me some more about how this is setup? Where do I get the AX25 device? How do I install/configure it? Will it work with all the versions of Linux for Mac (MacBSD, MkLinux, etc)? (I only have one PPC and had been planning on using a 68k Mac, which counts out MkLinux. Perhaps I can get a good second-hand PPC.)

Do you know of any other Ham specific Linux resources (especially stuff that will help me install and configure it)?

Thank you very much,

Yes, I agree. Is there a moderator on this NG?
If not, to whom can we go to get this type of garbage removed/filtered from the NG?

DAMA is fine when the load from each connected site is well balanced.
It becomes inefficient when the load is out of balance. It also suffers
when stations attempt to join the net or drop out unexpectedly. These
are common problems on user LANs, but are more managable on
backbone trunks. Mixing speeds is still horribly inefficient, even under
DAMA.

Maybe someone can help find information about the following applications.
I am looking for two system applications:
- A simple transmitter and receiver set that can send a
signal within a house to activate a relay or a light. What do you have
to do this? As an example, I have looked at a typical garage door system
and it will work, but it would have more capabilities than what I need.
- I am also looking for a long range transmitter/receiver (up to
3 miles) to send a simple signal (data burst). What do you have for this?

Please contact me at your earliest convience.

Here is additional info on this unit:

DSP-232 Dual Switchable Port DSP Multi-Mode Data Controller

The plug and play DSP-232 is Timewave's new state-of-the-art multi-mode data
controller designed around a high-speed, digital signal processor which
provides the ultimate in signal filtering, modem performance, and
flexibility. Timewave is known for excellent filtering systems. Digital
signal processing combined with memory ARQ, true DCD, and hardware HDLC
provide the best filtering available, and Timewave/AEA has been building DSP
multi-mode controllers longer than anyone (since 1991 with the
DSP1232/2232). Once you see the features, the upgrade capability, and the
affordability, your view of multi-mode controllers will be changed forever.

Modes
All proven modes are included. Send and Receive: packet VHF (9600 and 1200

bps) HF (300 bps), PACTOR, AMTOR (ARQ & FEC), RTTY (Baudot & ASCII), and Morse. Receive: TDM and NAVTEX. Also includes: Output Calibration, Signal Identification (SIAM&#65533;), & 16 software selectable modems.

Upgradable
The firmware upgrade capability for new modes like PACTOR II and new modems, such as for satellites, make this the premier multi-mode platform for the future. Timewave has a reputation of providing customers with frequent upgrades as technology advances, so your equipment will always be on the cutting edge. We've designed the DSP-232 to be a platform to which you can add features as technology changes.

Full MailDrop Facilities
There is 18K (32K RAM) of mailbox space standard which is expandable to a whopping 242K (256K RAM)-you will always have the message space you need. The MailDrop accepts messages in packet, PACTOR, and AMTOR. The internal battery holds the messages when the unit is turned off. The mail LED on the front panel display will alert you to new PACTOR, AMTOR, and packet mail. MailDrop also controls 3rd party traffic and receives, forwards, and reverse forwards messages. You have complete control of the MailDrop with Timewave/AEA's advanced commands. CFROM and DFROM let you select who may or may not connect and leave a message. MHeard lists the 18 most recently heard stations. Leave your DSP-232 on all the time, it will continue to receive/route mail and serve as a node, like all other Timewave data controllers.

Gateway as a Node
The Gateway firmware lets you "node-hop" to reach distant stations instead of digipeating; thereby reducing channel traffic and increasing data throughput. As with MailDrop, you have control of who uses your Gateway. Gateway also allows identification of TheNet, TCP/IP, and NETROM. There are two heard lists included with Gateway: one for stations heard and one for nodes.

Signal Identification (SIAM&#65533;)
AEA developed Signal Identification & Acquisition Mode to automatically detect incoming Baudot, ASCII, AMTOR/SITOR, PACTOR, and TDM signals, and with a few keystrokes switch to the recognized mode and start displaying data.

WeFax Reception
The DSP-232 includes a Zero-Crossing Detector for gray scale terrestrial fax reception with the optional Timewave FAX III 900 WeFax receiving program. This program allows you to receive WeFax images, colorize them with 256 color, then export them to .PCX or .GIF files for use in other applications. Also compatible with Timewave's WeFax 256 for Windows.

Power Filtering with DSP
The DSP-232 continues the Timewave tradition of quality signal filtering technology. Incoming signals are digitized by a high speed, analog-to-digital converter. The digitized data is then digitally filtered and analyzed by the on-board digital signal processor. The processed

demodulated signals are then passed to a second processor for protocol conversion. The reverse procedure takes place when you transmit. DSP gives the DSP-232 a better shape-factor than analog filters. In addition to the DSP, we've included PACTOR memory ARQ for reduced errors. All this makes the DSP-232 the data controller of choice for those who want to connect in poor HF conditions.

Packet Power
Run 9600 or 1200 bps VHF and 300 bps HF packet. This is a true DCD state machine for hearing signals with an open squelch when operating 9600 and 1200 bps packet. Full-duplex packet capability lets you speed up communications by sending and receiving simultaneously. KISS mode provides compatibility with the TCP/IP protocol. There are even special GPS capabilities which allow mapping and tracking in packet.

Packet Satellites
You can use the ultimate nodes, the BBSs in the sky-the satellites! Use 9600 bps, 1200 bps PSK PACSATs, and 400 bps telemetry. Take advantage of the satellite's store-and-forward capability. The satellites are up there, use them with the DSP-232.

Control Software
Timewave offers a whole line of state-of-the-art control software programs.
Microsoft Windows® users can use the powerful PC PakRatt for Windows.
DOS-based users will appreciate PC PakRatt II for DOS.

Global Positioning System
A GPS-specific command set is included in the DSP-232. These commands allow the controller to be used in Stand Alone Tracking, where you take the unit mobile and transmit your position to other packet operators using Automatic Packet Reporting System software. Remote programming allows you to set and change vital GPS commands from a remote location. You can also use Timewave's optional APRS adapter cable to connect a GPS receiver and a DSP-232 to a single COM port on your computer. The DSP-232 is GPS, Loran, and ARNAV compatible. It is even ULTIMETER-II compatible which allows you to set up a weather net or to hear weather nets.

Connect with the DSP-232
The DSP-232 has a rear panel connections for direct-FSK/Auxiliary to take advantage of your tone generating radio and AFSK port one and two. Timewave gives you both the direct FSK and the AFSK options for optimum flexibility. There are two radio connections (one for each radio port), two receive audio connections (one for each radio port), plus an RS-232 computer interface. There is even an 'option' slot for future advancements-we mean it when we say this is the digital platform for the future!

Specifications
Modem Analog Devices 2105 Digital Signal Processor running at 12.3 MHz in conjunction with Analog Devices 28msp02 audio CODEC
Modulator output level 5-100 mV RMS rear panel adjustable controls for each audio port
Processor system Hitachi 68340 running at 16.7 MHz

RAM Battery-backed 32K standard, expandable to 256K
ROM 128K standard, expandable to 256K
Hardware HDLC Zilog Z8530 SCC
Power Requirements +12 to +16 Vdc @ 1.1 A
Input/Output Connections
Radio interference One 5-pin DIN connector, one 8-pin connector
Direct FSK outputs Normal/Reverse
Terminal Interface RS-232C DB-9S connector with hardware/software handshakes
Terminal data rates Autobaud setting at 300, 600, 1200, 2400, 4800, 9600 bps; and 19,200 bps
RX Audio Port 1 and Port 2
TX Level Port 1, Port 2, and 9600
Other Station ground connector and external reset button
Physical
Dimensions 9.35" (237 mm)W x 7.9" (201 mm)D x 2.3" (58 mm)H
Weight 3 lbs. (1.36 kg)
Features
Fast digital signal processor
9600 & 1200 bps Packet
All standard HF & VHF modes
Mailbox expandable to 242K
Full MailDrop facility for Packet, PACTOR, and AMTOR
Two switchable radio ports with rear-panel AFSK adjustments and another adjustment for 9600 bps
GPS firmware which is compatible with GPS, Loran, ARNAV, and ULTIMETER II weather stations
GPS commands are remotely programmable
Gateway firmware which works as a node for faster throughput
SIAMTM signal identification
Memory ARQ
Identify TCP/IP, TheNet & NetRom

> after all.
>

If you want to lease a T1, ISDN or such, yes. However, in California, I pay Pacific Bell $16 a month for my line. That includes unlimited free local calling. Any LD charges are done through any choice of carriers, such as MCI, ATT, Sprint, etc. We choose our own LD carrier, and now it is commonplace to choose your own local carrier. Rates are extremetly competitive.

However, for home-telephone service, US$16 a month is not a bad deal, especially considering I racked up 110 hours of internet connect time last month.

> There is no such thing as a free lunch.

True, but our phone service here is close to it. Rates for business/commercial on the other hand are priced very differently.

It's already happening... the 47GHz part of the spectrum, later this
year, may see the first evidence of this. The amateur band up there is
in real danger if the commercial people "run out of space"...

Hey Guys!

Packet radio has NOTHING to do with Boatanchors so please DO NOT
CROSS-POST this kind of crap to rec.radio.amateur.boatanchors. We are NOT
interested!

Well,
One reason you can not copy AMTOR may be because AMTOR almost doesn't exist anymore!..What you are trying to copy , in all probability, is PACTOR. It would help if you mentioned what software you are using with that PK232..I hope its not Hostmaster!..

The TAPR 9600 modem kit includes detailed instructions for use with a
PK-232MBX. TAPR also offers a pre-made cable kit for the MBX. See
www.tapr.org for details.

Perhaps you should thank us. If we hadn't been "throwing another
log on the fire" the Ice Age would have returned by now and you
Brits would be under a mile of ice.

>Maybe it's time the retail price of your gasoline

Hey, I *like* global warming, makes these old bones lots happier
when the winters aren't so bitter, like they were when I was a boy.
And you must be a flaming socialist to want to tamper with the
free market. Fuel should cost what it is worth, no more, no less.
Even $0.82 a gallon is a distorted price because that includes
$0.30 a gallon state and federal taxes. But they're earmarked
to build and maintain highways, so I can't complain about that
too much.

>Incidentally, how much do you pay your Government in Income Tax? My
>top rate of Income Tax is 25%, and I pay no tax at all on the first

Top rate in the US is 38%, but that doesn't kick in until you start
dragging down some serious money. The first $8,000 is tax free,
and the average taxpayer's rate is around 27% on the rest. Some
states have an income tax, in Georgia the top rate is 4%, but others,
such as Florida, don't have an income tax at all. Now what's this
I hear about a monsterous VAT you Brits have to pay?

Receivers using comb filtering and the VIR pulse don't mess up the
colors either. The alternate line phase of PAL was once an advantage
in editing, but today with the universal use of RS-170A that's no longer
a problem for NTSC. And the extra resolution of PAL is more illusion
than reality. The 4 MHz video bandpass only allows 232 pixels per line
horizontal in either system, and NTSC has 262.5 vertical lines in a 3:4
aspect ratio, so we already have more vertical resolution than horizontal
resolution. The major difference is PAL's 25 Hz frame rate (flicker flicker)
as opposed to our 30 Hz frame rate. That's very noticable, and annoying.

I have used kermit for this.
Easily found for the PC (DOS, WIN 3.1, Win95/NT) on the net.
Harder to find for the VAX (assume it runs VMS), but it is available.
Then you need to hook the two machines together via serial ports.

Gary OM,

How right you are! So many consumers (which is, to me, a derogatory term, meaning advertising believers, in previous times known as suckers) cannot seem to understand that higher octane gasoline does not give you more power, or more mileage, from an engine designed for lower octane. It is a physical impossibility. I first discovered this while reading a 1918 textbook on internal combustion engine design. It is interesting how very little fundamental knowledge is really NEW!

Best 73,

Don, W6JL

Hi, Matt...Bill, K7RD here.

I use a KAM+ with my 386/SL25 MHz laptop. The KAM is small, does everything...requires very little power drain from 12VDC source.

My KAM+ is used in my mobile only...it stays mounted under the dash, never is removed. I use it with my FT-747GX on PacTOR mostly...and I also do some 2M packet with it, using a FT-211RH. Both radios stay in the car all the time.

The KAM+ is very stable...does not mind constant power interruptions. And, it's is not affected by RF from the nearby whip antenna, running 50 watts.

The program I use for the KAM+ is KaGOLD. It is a DOS-based program...I would much prefer XPWare For Windows, but my old laptop will not run Win95.

Gary, you know as well as I do that spread-spectrum has the potential
for solving the two biggest problems of the current FSK 56kb system,
those of radar interference and multipath. Those two alone make 56kb
using DSY modems nothing more than a frustrating experiment, rather
than a technology that's ready for wide adoption by hams everywhere.

Yep, guess I've been spending too many hours behind the keyboard, and
not enough time playing (or learning how to spellcheck!) :-)

Man, every house I see here in the states has a DBS dish. Get your
facts right.

> We are now moving rapidly towards digital TV systems here, and wide
> screen TV sets with provision for digital compatibility are already in

DTV is reality now in the top 10 markets here in the U.S. It will be in
the top 31 markets by 4Q98, and the top 70 markets by 4Q99. That's most
of the U.S. population.

You obviously haven't seen enough TV about what goes on in the states.

A more likely scenerio, is the use of UHF FSK for trunking, and SS on the local LAN. I've seen some published papers which show most of the microwave stuff has a tendency to just bounce off the inversion layer between the high site and the users down below. You may have to step up the mountain anyway, and then latency time enters into the equation.

The FSK LAN is pretty much a dead idea, if sales are any indicator.

I said cheap shot because its always easier to come along ten years later,
make improvements based on what has been learned with an earlier
experience, and then crow about your "superior" system - both of which
will likely be supplanted by new wider digital formats anyway. As for the
Amercians doing nothing, they've been working on high definition new
formats for at least the past decade, which I'm sure you know already. And
I haven't done anything about it because I'm not American, nor do I work
in the broadcasting industry.

>I notice whenever anyone has the effrontery to criticise anything
>American, it's always "a cheap shot".

Naw, the Americans can look after themselves, but it was a cheap shot
nonetheless.

I rather doubt anyone in North America ever had 10m diameter dishes unless
they were commercial earth ground stations. Most of the C Band dishes were
more like 2 to 3 m in diameter, and most of the dbs dishes are about 65 cm
in diameter.

Hiya,
I'm trying to find the product that we can set up for packet radio. I am new to Ham Radio. I'm mainly interested in packet radio. Could anyone of you recommend a specific product for TNC and radio? We would like to hook up the laptop to packet radio. Isn't there TNC that supports pcimia (laptop)? We are interest having a radio to a desktop pc and also a radio in a vehicle hook up to laptop. Any suggestion?

Thanks.

If you intend to use it with OS/2 as a WIN-OS2 operation, while you are digging for things be sure you get a copy of the OSTSR time slice release utility. This one is free ware. At least install it with your setup, otherwise PPWIN will clobber your CPU load.

The best utility for bringing it under control in OS/2, to my experience, is the TAME320 utility, but that one will cost you a few bucks to register. It is more versatile than OSTSR and has let me do some things I needed that OSTSR wouldn't do...

Apparently, not well...

They do detect the other, but only to the extent that it is just
an occupied channel. From trying this locally, it is better if
the channel only has to syncronize same-rate traffic between nodes.

At least this is the way it was explained to me.

This is not a problem. There is so much open vacant amateur spectrum at
UHF and SHF that this simply isn't a concern. And amateur density is never
likely to become so great that it will become a concern.

>56k Spread Spectrum is the keyword. (or higher).

Now lets talk about expensive. How much more will a SS radio cost for
the same throughput than the currently available FSK solutions? Don't
forget that Part 97 restrictions mean we can't use off the shelf Part 15
equipment. So we won't benefit from mass market economies. And
how much more will a SS *repeater* cost compared to a FSK solution?
Topology won't let us get by without them.

>[snip]
>
>> The technology I mentioned above has been off the shelf for amateurs for

>
>The bandwidth is too large, the whole system depends on high central sites.
>The large bandwidth isn't shared.

The bandwidth doesn't need to be shared, there are hundreds of MHz sitting
vacant. And the occupied bandwidth is a mere fraction that of a SS system.

Any wide area system must depend on high central sites. Amateur density
on the ground is far too sparse, and terrain too complex, to permit simplex
peer-peer topologies. And that isn't going to change. The mountains aren't
going to tumble, and the populations of urban centers aren't going to be
uniformly spread across the country.

>> As noted, we've been using 56 kbps digital radios for 12 years here in GRAPES,
>> T1 digital radios form the backbone of the Slovenian network, TAPR is tinkering

>> packet switched networking.
>
>56k and T1 are analog modems. I call it the Foghorn technology. That is, the
>spectrum is consumed wholesale, rather than shared. Spectrum problems is what
>makes packet radio non-fun.

Then get your butt off 2m and start using some of the hundreds of MHz of
completely empty and vacant amateur spectrum above 2m. There is no
current need to share spectrum on upper UHF, and there is no foreseeable
scenario where amateur occupancy can grow sufficiently to change that.
And we damn well better start using that spectrum or we'll lose it. *Then*
we might be forced to try to use the more expensive and more complex SS
technologies in order to get by on the little spectrum we may have left.

The only thing SS brings to the table that we need is the ability to share
spectrum. But the only places where we need to share spectrum are at
HF and VHF. We're prohibited from using SS there. At upper UHF, we
simply don't need that ability to share spectrum, we have hundreds of
MHz of vacant spectrum, and we can reuse it geographically. We need
to *occupy* that spectrum in order to keep it. The most cost effective
and immediate way to do that is with high speed FSK systems.

And indeed DTV terrestrial broadcasting starts here in October of this year,
which will neatly leapfrog your primitive analog system. But tell us, Walt, what
sort of color TV did you have in 1954? We had NTSC, you had zip. Being first
sometimes means you don't get to take advantage of an incremental improvement
like PAL due to installed base.

>Maybe some day, too, you will have a 100% digital telephone trunk

>(A qualified car mechanic told me this ... so unless you're an expert
>on cars don't flame me :)))

The only real benefit to leaded gas is reduced valve wear in certain
older engines. For the past 25 years, we've used hardened valves
and seats which no longer require lead as a lubricant. There are
other ways to boost octane for the high compression engines which
need it than by adding tetraethyl lead.

What your mechanic was probably trying to say is that engine
efficiency is directly related to compression ratio. The higher
the compression ratio, the better the engine's efficiency *can
be* (though it isn't always better in practice, depending on other
design tradeoffs). When lead free gas was introduced, most
engine makers dropped the compression ratio of their engines
from 10:1 to 8:1 because of fears of pre-ignition. But compression
ratios have gradually moved back up as reformulated fuels and
better combustion management systems have become available.

For a given compression ratio, you get best performance by
using the *lowest octane* fuel which does not cause pre-ignition
(knocking and pinging). That's because lower octane fuel has
more BTUs per pound than higher octane fuel. That's something
the fuel companies really don't advertise because they'd like you
to pay extra for higher octane fuel you don't need in the mistaken
belief that it'll make your car run better. It won't.

The best person to go to is yourself. Use a good threaded newsreader with
a regular expression filter capability and you won't see this sort of thing. A
good newsreader allows you to customize what you see so that *you*
determine what you get from a newsgroup, or collection of newsgroups.
Rather than depending on someone else to be your nanny, you can make
your own choices. Freedom, what a concept!

Nobody is disputing it. I think Walt's point was that (a) PAL is
significantly less prone to messing up the colo[u]r, and (b) the extra
100 lines make a significant difference to the vertical resolution.

I will refrain from comment on SECAM.

Actually, we did. A number of initiatives going under the heading of ATV
(Advanced Television) have been implemented over the last 20 years
which have markedly improved our analog TV system. The most important
of those is probably the mandatory adoption of RS-170A as a synchronizing
standard. In addition, the near universal adoption of comb filtering to remove
the herringbone rainbow artifact has been a large improvement. And we've
inserted the VIR pulse in the vertical interval so receivers can maintain
correct hue and saturation of broadcast pictures. There have been a
number of other improvements as well, but those three have changed
NTSC from Never Twice the Same Color to Now Truly the Same Color.

But of course DTV will obsolete all of that.

Gas as far as I remember never had lead in it. The good thing about gas is that
is is so much cheaper than other fuels for central heating. Much of the UK
electricity supply comes from burning gas as we have large reserves.

If you're using them on the 430-450 band in San Diego when the fleet's
in maybe ... but in most places, in most bands above 2m, there's plenty
of clear spectrum. Multipath should be only a transient problem in
point to point links and retries should take care of the transient errors.

A nice Reed-Solomon code would be nice, too ...

If I'm running TCP/IP over an Ethernet link layer (e.g. the datalink looks
like an ethernet cable) could I just send something using TCP/IP, or would
I need to ensure that the entire ID packet fit into one ethernet packet?
I was thinking of just using some ping-like software to send something
across every so often. The design I'll be using (the N6GN microwave
design) includes a voice channel, so I could do CW over that, but I'd like
to avoid the trouble of having to add an IDer circuit. Anyone know if
this would qualify as a "published" standard format under that rule?

Thanks,
David Carter, N0RTY

Naval radar may be a problem in San Diego if you're trying to operate
on 70 cm. But for most of the continental US, naval radars aren't an
issue, and you don't have to restrict yourself to 70 cm operation. We
started out on 70 cm, but now our network includes links operating
on two other bands as well. We can operate on any band for which
we can obtain a transverter.

And I'm not at all sure that the necessarily wide open front ends of SS
receivers wouldn't be affected by naval radars anyway. Our experiments
with Part 15 SS equipment have shown that it just folds up and dies in the
presence of strong in-band signals. We've been trying to get some 2.3 GHz
Part 15 SS equipment to work on Sweat Mountain for quite a while, and
it just can't hack the high RF environment. But the DSY modems work
up there nicely behind some sharp cavity filters. It makes a *huge*
difference when you can hide behind 70 kHz wide filters instead of having
to accept a 10 MHz or larger span. On Sweat, you read 4 or 5 watts
reverse power on the antenna with your transmitter *off*. And Sweat
isn't the worst high site we have to use either. Bell Center is worse,
and in some ways Lanier is worse yet. But we've been able to make
DSY modems work on all of them.

Multipath can be a concern if you don't have a line of sight path clear
of the first Fresnel zone, but the newest DSY modems offer FEC to deal
with that. We've been using a couple mobile in motion for quite a while,
and multipath degradation just isn't that bad. Like any mobile, you
occasionally stop in a null and have to pull up a foot or two to get the
signal back, but even SS isn't a panacea in that regard, we've found
plenty of nulls in our Part 15 experiments too. (And the inability to
make them work on high sites has made that problem much worse
because we're almost never line of sight.)

Now I am sure that the strong signal handling problems of SS equipment
can probably be solved with a robust enough front end design, but I wonder
if the TAPR radios will have that robust design. If they can't hack our high
sites, then we can't use them.

Hi Matt,
"Packet" is such a broad term. Alot depends on what aspect of packet interests you the most. For instance, if you are interested in APRS (hooking up a GPS to a TNC and a radio, and beaconing your location for the rest of the world to track), I'd suggest the KPC3+ or KPC9612+, since their ROM's have been enhanced for APRS packet operation. Additionally, they run on *extremely* low power (can even be configured to run off of a 9v battery!) -- and are quite usable on packet BBS operations.

Other facets of packet operation may have other suggested hardware purchases. As you can see, the answer to your question isn't as straight forward as you may have thought.

Regards,
Ev, K2IV

No, it is not enforceable. The few court attempts have failed.
E-mail and bulk mail is NOT fax material, so the fax statutes
do not apply - even though they say that any device "capable"
of receiving faxes is included.

Until the legislators decode to do something decent, and make
such bulk mail illegal, you are going to see more and more of
the trash mail. The mailers are now good enough that it takes
a concerted effort from numerous sites to determine the actual
originating site.

Until such time - notices like the above are just a waste of
bandwidth.

I'm assuming your vax II is running VMS? If so, get yourself a copy of Kermit. One for both your VAX and your Pentium, connect the two together with a serial cable and have the two kermits talk to each other. If you VAX has an ethernet adapter you could bring up DECnet or TCP/IP but that would be much more work and require a license for the software on the VAX, but would be the way to go if you are going to make a habit of this.

> in editing, but today with the universal use of RS-170A that's no longer

Down here in Europe we say Never Twice the Same Colors vs Perfect Art Lines ;-)
Pse no flames, just kidding... We don't even have PAL in France, but SECAM...
Well my SONY camcorder uses PAL and my TV set can understand both.

> a problem for NTSC. And the extra resolution of PAL is more illusion
> than reality. The 4 MHz video bandpass only allows 232 pixels per line
> horizontal in either system, and NTSC has 262.5 vertical lines in a 3:4

Hmm, 100 vertical lines are 100 lines more !

> resolution. The major difference is PAL's 25 Hz frame rate (flicker flicker)
> as opposed to our 30 Hz frame rate. That's very noticable, and annoying.
>
Hence the 100 Hz digital TVsets which double the image scan rate, no more
flickering at 100 Hz, 60 Hz is not even enough, 50 Hz is terrible...

It seems that the TV standards scan rate used to be matched with the mains AC
frequency to cope with the electromagnetic field produced by the transformer
and generating beat distorsion in the images. At least with matched scan
rate, the distorsion was stable...
I guess it is no more a provblem as of today, considering the multiple
scan rates of PCs. Transformers are probably well shielded.

parnoul@gaap.saclay.cea.fr writes:
>I guess it is no more a provblem as of today, considering the multiple
>scan rates of PCs. Transformers are probably well shielded.

These days, TVs and monitors don't use 60 Hz transformers at all.

A TV or fixed-frequency computer monitor typically runs the horizontal
sweep off rectified line voltage, and derives all of the other voltages
it needs from extra windings off the horizontal sweep transformer.
So any magnetic interference is phase-locked to H sweep - no beat
frequencies possible.

Multiscan monitors are a bit more complex since the H sweep has to
operate over a wide range of frequencies. They typically use a
separate oscillator, still at relatively high frequency, for the
power supply.

Even back in the very early days of video, depending on the vertical
sweep to be the same as the line frequency couldn't have worked for
network programming. The local electric grids in various parts of
a country as large as the US or Canada are not locked together, yet
all TVs were locked to the sync generator at the studio where the
TV cameras were located.

>the high site and the users down below. You may have to step up the mountain
>anyway, and then latency time enters into the equation.

Whether there is an inversion layer intervening between the mountain top
and a user area is dependent on a number of factors. We don't see problems
with it here in the southeast because our mountains aren't that tall, and
because weather patterns over our hilly terrain don't favor formation of
low level inversion layers. It is likely more of an issue in southern California
where the mountains are taller and the users live in a trapping basin which
forces the stagnated conditions favorable to inversion layer capping.

SS doesn't bring anything to the table here. It is just as subject to the
inversion layer as is FSK. It is still necessary to provide connectivity
to the users via high sites regardless of whether SS or FSK is used.
SS doesn't magically solve RF line of sight problems. In the vast majority
of cases, the amateur community is too sparse and too dispersed over
terrain blocking direct line of sight to be served by anything except high
sites, regardless of the modulation chosen for the upper UHF signal.

This is something that SS proponents seem to like to sweep under
the rug. But it is the reality that will likely keep SS as a marginal
player in amateur packet networks. We aren't thick enough on the
ground to allow simplex nets hopping from user to user (and most
users don't stay on the air 24x7 anyway, so they are undependable
relay nodes). We cannot possibly afford to install cellular networks.
We don't have the sites, and we don't have the money to do it. We
must realize that ours will always be a very sparse network topology.
And that means high site relay. SS is not well suited to serving a
sparse topology, and hasn't demonstrated an ability to function
at high sites with their high RF levels.

>The FSK LAN is pretty much a dead idea, if sales are any indicator.

I don't see how you can say that. If sales are any indicator, use of
SS is *ZERO* in amateur LANs. Use of FSK (or AFSK) is universal.
Before GRAPES stopped producing kits, we had shipped over 3,500
units. I don't know how many W&T units PacComm has sold, but they
have had to make several board runs so far. There can be no doubt
that the DSY modem is the dominant technology in use by amateurs
for 56 kb or faster, though the Slovenians have a national network of
1.2 Mb FSK systems and I hope the popularity of that system spreads.

G3RUH is the dominant FSK technology at 9.6 kb terrestrially and
via satellites. But that technology is only incrementally better than
the Bell 202 AFSK it displaces. It still depends on the bottleneck of
a voice grade FM radio.

Now tell me again how many Part 97 compliant SS systems have
been sold? ZERO. So tell me again how FSK is a dead technology.
It seems to me that it is the *dominant* technology for speeds over
1200 baud.

Of course sales of these systems are overshadowed by the enormous
installed base of 1200 baud AFSK systems, but those are legacy systems
which I'm sure both of us agree need to be replaced.

<snip>

My comment was aimed at the poorer fuel consumption experience after
the introduction of catalytic converters (not at the use of unleaded
fuel)....my original posting underlined the cat converter with the
^^^^^ symbol but it did not come out that way on the newsgroup!

When questioning the dealer who supplied our latest car (a 1.2 litre
General Motors thing) about the poor mpg (only 32 in the city and a
bare 40 to 42 on the motorway) and comparing this performance to our
previous car, a Fiat of the same capacity (44 in town and 56 mpg on
the open road) we were informed that catalytic converters degraded
mpgs by as much as 30 percent or so...

Anyway, what's this to do with amateur radio? :))

HUH?

Leaded gas was very cheap petroleum distillate (low octane=~70 or so)
spiked with tetraethyl lead -- (CH_3CH_2)_4Pb -- as a cheap way of
bumping the octane up. 15 drops of tetraethyl lead added to a gallon
of 70 octane gasoline would bump the octane up to 100. This was great
until the lead started damaging the environment. Then we had to pay
more for higher quality gasoline with more expensive additives (like
Methyl-tert-butyl ether -- MTBE).

As far as I know (still a student pilot) 100LL Av Gas (100 octane low
lead) has no lead in it at all, but the name is still used from when
there were several varieties of Av Gas available (At least that's what
the guys at the air service tell me).

I don't think gasoline was ever made from coal -- at least not in any
commercial quantity. It was considered back in the 70's when gas
prices were skyrocketing, but petroleum based gasoline would have had
to go up to $3.00/gal (1970's US dollars) to be cost effective.

God gave you a free will, and the "democracy" you complain about not having is, in fact, exactly what you do have and is persecuting you. Why haven't you simply moved to another country? You could qualify for a station license with hard work and only the usual amount of beauraucatic politics, and wouldn't have to look for handouts to have a voice.

Interesting point that. In fact our local Sainsburys has started selling
'low sulphur - City Diesel' I asked what this was all about and was told
that it is being introduced across the country, although this is the
first time I have seen it. Price is 1p/ltr on top of normal price. Small
price to pay for lower emissions? I really wanted to know what 'exactly'
is the composition of it? On my Open Uni degree course this year we have
been looking at alternative fuels and one of them is an alternative
diesel fuel derived from rape seed oil. Apparently called 'bio-diesel'
it has very low sulphur emissions, low particulate discharge but stinks
like rotten cabbage when used! I also wondered about performance so such
fuels? Although the local bus company is using this low sulphur diesel
to such an effect that all the taxi drivers are using it, but it seems
that they think it gives better MPG than normal diesel.

Natural gas burns much cleaner than any other fossil fuel (CO2 and SO2)

Predictions are that current 'known' reserves will last until at least
2025

Nothing wrong with the A40. I used to have one of those.
Petrol prices then were at about the silly level they are
in the USA today so the MPG didn't matter quite so much!

My present one uses the fuel of the future - diesel.
It returns 50 mpg from a 2-litre direct-injection
engine (with a catalytic converter).

Just about everything's illegal in Canada.

I've been led to believe that, provided all the traffic
passed over any (theoretical) Internet/Amateur Radio
interface is originated by and destined for licenced
Radio Amateurs, then such an interface would not
be illegal.

I'm thinking about buying a Kantronics KAM Plus, but I just found out
from the dealer that Kantronics no longer has a version of their Hostmaster
software which runs on the Macintosh. I've done some web surfing and have
tracked down two or three DOS/Windows Host mode programs but I haven't been
able to find anything that runs on the MAC. I would appreciate any info
on available Macintosh-based software for the Kam Plus.

You mean't to say FSK (and I mean't UHF FSK) is just as subject to
an inversion layer. I already said SS has that problem. But I didn't
mean UHF or VHF or HF SS, I was thinking of microwave. The
wavelength of 70 cm is much different propogation than microwave.
You couldn't extrapolate whatever knowledge you have in one band to
another.

My basic (unstated) thesis was, that most Hams could care less about
long range RF networking. We've had long range 1.2 kpbs links for
years, and I even ran a wormhole off and on. None of it gets that
much use. Therefore my conclusion, that a high speed LAN would
tend to be a local SS thing, and the FSK trunks could fill in as places to
find and route those God damned chat nodes, etc.

If we are talking 5 years from now, and I think RF per kbit is way
overpriced until then, then we will be competing against 4 Mbps fiber
nodes from the cable company, at the same price we're paying now
for 33k. The Ham will be doing (maybe) 115k pseudo-full-duplex.
So any increase in speed in RF is probably always going to be
1/30th of wired networks.

>This is something that SS proponents seem to like to sweep under
>the rug. But it is the reality that will likely keep SS as a marginal

>must realize that ours will always be a very sparse network topology.
>And that means high site relay. SS is not well suited to serving a
>sparse topology, and hasn't demonstrated an ability to function
>at high sites with their high RF levels.

Your mind is a product of the past. High site, foghorn design, all that is behind us. Sure it will linger; hell AM CB still lingers. Let's get serious now. Who, in their right mind, would choose directed routes over free flight? Even the FAA has seen the light, and is abandoning the funnel paradigm for the spray paradigm. Yes, we will have to change the level 2 protocol. I can design on paper at least four ways to out-perform your funnel design. The best being intelligent nodes that passively determine routes. Or even actively determine routes. As long as the ping time is in the millisecond range, the system will be highly usable.

>>The FSK LAN is pretty much a dead idea, if sales are any indicator.
>

>for 56 kb or faster, though the Slovenians have a national network of
>1.2 Mb FSK systems and I hope the popularity of that system spreads.

OK you win. Yes sales are skyrocketting and millionares are being made every day.

>Now tell me again how many Part 97 compliant SS systems have
>been sold? ZERO. So tell me again how FSK is a dead technology.
>It seems to me that it is the *dominant* technology for speeds over
>1200 baud.

Who cares about Part 97? Why would I operate Part 97 when I can operate without restriction using the same technology. I would hazard a guess that SS units are selling over 3500 units a month to your FSK boat anchor (high site) sales of 3500 over 10 years.

Get out of your house for a few days and see the world that's passing you by.

Steve

Diesel the fuel of the future? Not likely....Hydrogen is far more likely
as a fuel of the future than any fossil fuel, especially when the only
byproduct is water.

Actually, there is argument for completely flat rates at the national
level for telecommunications - i.e. no toll charges for long distance at
all both in Europe and America.

I find it difficult to understand your hostility to flat rate local calls,
though. What is your basic objection?

It seems to work just fine in North America.

>They're totally anti-diesel over there as well.
>I'm told you can't buy it unless you own a lorry
>(truck).

What a silly idea! Of course we can buy diesel wherever we want. There are some of the older VW Rabbit diesels running around here, plus the odd Mercedes. Where on earth do you guys get these far-fetched notions about North America?

The reason diesel isn't very popular is because:

1. It stinks more than gasoline when the engine is running,
2. Diesel engines produce less power than equivalent sized gasoline engines (in
cars, anyway),
3. Diesel engines are harder to start in cold weather,
4. Diesel fuel here costs about the same as gasoline
5. Diesel engines are generally noisier than gas ones.

I suspect point 4 is the deciding one, though.

I have one (1) AEA CP-1 computer patch interface for sale. This unkit was popular in the 1980s when home computers first came out. Great if you have a C64 or VIC20 and want to get on RTTY. Best offer.

Far from it. Most gas stations that service the public have at least
one Diesel pump, and they certainly don't ask whether you're fueling
your car or your Kenworth truck.

Many years ago, diesel fuel here was substantially cheaper than gasoline.
At one time, back in the 70's, using diesel was considerably cheaper than
gasoline. Not any more, though, so why bother with the extra cost of
buying and servicing diesels?

Actually, quite a few current TV sets have mains transformers in them -
somewhat to my surprise.

I don't know about SM supplies being "cheap and reliable" - to
manufacture maybe, not so much for us poor engineers who have to fix
them!

Since I operate microwave sites professionally, I can tell you that you
can extrapolate inversion layer effects between 70 cm and 2 GHz.
The inversion has to be a little harder to affect 70 cm than it does to
affect 2 GHz, but not much. Generally, if the layer gets one, it gets
the other too.

>My basic (unstated) thesis was, that most Hams could care less about

I'm not worrying about national webs either. I just want to be able to
connect to *at least one other ham*, preferably several other hams.
And in hilly terrain, that requires a high relay site. I don't know how
many digital hams you think there are within line of sight of the average
ham's house, but I can tell you the average number, and that is ZERO.
We're not that thick on the ground.

>If we are talking 5 years from now, and I think RF per kbit is way

>for 33k. The Ham will be doing (maybe) 115k pseudo-full-duplex.
>So any increase in speed in RF is probably always going to be
>1/30th of wired networks.

Hams are already doing 1.2 Mb. They've got a national network
in Slovenia, and using equipment you can build for less than we
pay for a voice grade FM rig and TNC. Single channel FSK rigs just
aren't that tough to build. I can get a 1.2 GHz FM ATV transmitter
out of Texas for $140. It'd take about 5 minutes tops to make it a
fast FSK rig. The data pump is a little trickier, but the RF is a cinch.
There's no real excuse for hams being slower than the wired networks.
The phone companies pumped T1s around on FSK microwave for
decades. It isn't rocket science. And it needn't be expensive either.

>>This is something that SS proponents seem to like to sweep under
>>the rug. But it is the reality that will likely keep SS as a marginal

>the system will be highly usable.

Wonderful. Now find me *just one route* to another digital ham, *any*
other digital ham, that's within my line of sight range. In 90% of the
country, you can't. Without high site relay, we're stuck talking to

ourselves. How long is it going to take to get you to understand
that we aren't that thick on the ground? In GRAPES we have about
500 hams spread over parts of 3 states. And for most of us, the
only thing we can hit is a high relay site. We can't hit *any* other
digital operator directly *at all*. Ping as you will, it won't do you
a damn bit of good if there's no path to the next ham. We need
those bloody expensive high sites because they are the only
connectivity we've got.

Oh, sure, some of us can hit another ham or two on 2m 1200
baud, but for a high speed UHF link, we need a direct path.
I have another digital operator only 3 miles from me. But I
can't hit him at all direct. There's a bloody hill in the way.
The only way we can connect is via a high site both of us
can see that's 15 miles away. *That's* the real world.

Yeah, but it was cat converters that forced adoption of lead free gas.
The lead poisoned the platinum catalyst. Turns out there are other
benefits to removing the lead, however, such as much longer spark
plug life. The valve wear problem was the only real downside, and
that's a solved problem.

>When questioning the dealer who supplied our latest car (a 1.2 litre

>mpgs by as much as 30 percent or so...

Then GM Europe is trying to cut corners. We've had low backpressure
cat converters over here for years. Our big V8s and V10s wouldn't be
happy with restricted breathing. The MPG for our vehicles has increased
since the introduction of cats. Of course a low backpressure cat is pretty
large, probably wouldn't fit under the shoeboxes sold in Europe, but a pair
of them go nicely under a 4x4 pickup (which our government just informed
us in a backhanded way is 25 times less likely to result in a fatality for its
occupants than an econobox in a collision). There are good reasons why
we like to drive heavy iron besides the fact that it makes a wonderful
counterpoise for our HF antennas.

>Anyway, what's this to do with amateur radio? :))

Nothing. But it is a nice break from the code/no code wars.

>(truck).

Well, no. Diesel is available at some gas stations, usually 1 pump out of 24, but a truck stop is a more reliable place to find it. There are plenty of those around, and they will sell to passenger car and light truck drivers as well as to the big rigs. It is a hassle though to have to line up behind a rig taking on 300 gallons when you only need 25.

I don't think any of our domestic auto manufacturers offers a diesel powered passenger car anymore. They did at one time, but then the government put a 25 cent a gallon surcharge on diesel, making it more expensive than gasoline, and that pretty much killed the diesel car market. The diesel car market wasn't large in any event because of the much poorer performance of the diesel compared to the gasoline engine. Cheap fuel was the only thing that kept it going. And there was a problem with noise and particulate emissions too.

Diesel engines are still available for pickup trucks. I owned one about 12 years ago. It got decent mileage, about 38 MPG, but a kid on a tricycle could out-accelerate it. It was positively dangerous to try to merge onto an expressway with it, or cross a busy street. I went back to a gas powered truck with some zip.

Recently, the domestic light truck producers have offered 6.5 liter Cummins turbo diesels in their vehicles. I drove one recently and it does have decent zip, though still a far cry from a V10 Viper powered Dodge 4x4. But with the differential in fuel prices, I think I'll stay with gasoline power for my next truck. I sort of have my eye on a Chevy Big 10 with a classic 454 LS6 V8. That sucker will light the tires until you tell it to quit.

Oh I don't know about that. We had fully electronic television (525 line 60 Hz)
starting with round the clock broadcasts from the New York World's Fair in the
30s. And by 1948 we had a national network (NBC) running a full schedule
offering newscasts and entertainment programming. CBS joined in soon
after, and ABC came in with a full schedule 10 years later. How long did it
take before you had 3 full schedule (7AM to 1AM) competitive national networks?

>making incremental improvements over the years.

Yeah, but then you didn't have an installed base of 100 million sets
in the 1950s either. We did. When we went color, we had to stay
compatible with that base. Of course our TV has always been
private enterprise and has had to maintain a customer base. Your
government owned monopoly could care less.

>Here in Europe, we were leaders in the field of direct broadcast
>satellites with small (less than 1 metre diameter) receiving dishes.
>Meanwhile in North America, you were still playing around with clumsy
>10m diameter dishes like miniature radio telescopes in your backyards.

Actually that was 3 meter dishes. 10 meter dishes were only needed for
uplink stations. Now nearly every suburban rooftop seems to be sprouting
a 45 cm dish for DSS (500 channels). But there are still a lot of the older
3m dishes in rural America. DSS has a monthly charge. Most of the C
band programming is still free (or dirt cheap) because it is advertiser
supported. I have a 3m dish and enjoy watching a lot of the raw pre-feeds

on the back haul channels, and have been since distribution went to satellite in 1984. Have you been getting satellite TV that long?

Greenhouse gases. Oh the horror!!!

>Predictions are that current 'known' reserves will last until at least
>2025

And we've operated under a projected 25-30 year reserve every year
since 1900. In 2025 they'll probably be telling us we have enough reserves
to go until 2050, at a higher price of course. Meanwhile we have right here
in the US alone enough proven coal reserves to meet the world's energy
demands at current levels for 1,000 years. Of course we aren't using much
of that right now. Most of our generation has switched to natural gas, gotta
eat up that 25 year reserve you know so the gas companies can increase
their prices.

If anyone seriously cared about the environment, we'd stop greenhouse
gas production cold and switch to a fully nuclear powered energy system.
We have tens of thousands of years worth of proven reserves for that.
Instead of gigatons of CO2 and megatons of fly ash to dispose of every
year, we'd have a few hundred pounds of hot stuff to pile out in a desert
somewhere and put a fence around.

But that won't happen because 1 in 7 jobs revolves around fossil fuel
production, distribution, and consumption. There's too much money
and too much vested interest in keeping that system going to its last
gasp.

RIGHT while I have had the flue over the last few days and have not checked this little posting (which is growing into a monster !!!!) for a little while, I was amazed to see it has grown from my inital posting to 89 thus far!!!!!!!! Going from Internet access via Packet radio, somthing about govermnet should pay for everything, to TV, to Vehicles GAS etc etc etc HUH!!!!!! MAN!!!!!

OK well I found out what I wanted to find out, best help was from David TSE, and a link to force9 etc, i was able to find out that the technology IS available to actcheive FULL internet connection via Packet Radio. NOW wheather the HAM laws on Packet radio contents will allow internet access in England, and IF things might be changing (loads thing changing in this country NEW labour) new laws etc etc and wheather there is a line of site gateway from my location within say 60-100 miles of me, has all yet to be determined.

But my initial thoughts of wheather the technology exits has been answered YES IT IS. I Have found that it is Possible.

It may interest all who have responed to my initail posting that i
have found another way of connecting to the net which if is successful
will give me 120hours/month FULL internet access VIA ISP through a
MOBILE PHONE FOR JUST £32/month, which price also INCLUDES an ISP
monthly charge of £12...YES I KNOW BUT IT IS TRUE.

ITS not full free access but 120 hours FULL Internet access for £32
all in aint bad at all PLUS its legal.

So 89 Posting upto now....I wonder what the world record is on postings to a NewsNET posting is? Anyone know? Wanna Join this Fast growing Posting?

DO TRY AND KEEP IT TO DIFFERENT WAYS OF CONNECTING TO THE NET, USING ANY FORM OF TECH. RADIO, MICROWAVE, CABLE, TELEPHONE, SAT, ETC ETC ETC WHATEVER. IT MIGHT TURN INTO A USEFUL GUIDE YOU NEVER KNOW.

IF YOU CAN GATHER YOUR DATA AND POST ALL WILL BENEFIT, COULD BE GOOD THIS.WILL HAVE TO WAIT AND SEE.

DREAD TO THINK WHAT WILL HAPPEN AFTER THIS POSTING!!!!!!! hehehee

TO ALL

Cheers

IAN

Release Notes - IM/Mac 1.0b28h

Written by Ivo Van Ursel, ON1XK
Copyright 1991-1998, Ivo Van Ursel
Portions of this software are Copyright 1990-97 Aladdin Systems, Inc.

IM/Mac is copyrighted freeware software. Copies of IM/Mac may be freely distributed for non-commercial purposes, provided copies of this Release Notes file and IM/Mac are included together in unmodified form. Commercial distribution, including distribution on compilation CD-ROMs, must be done under license.

- The SetCCursor() ToolBox call potentially moves memory and thus cannot be used in interrupt code. The colored BeachBall cursor returns to black and white as a consequence.

- Fixed unimplemented A-trap error on PowerBook 100 (any original QuickDraw Machine) for the PMgrVersion() ToolBox call.

- Fixed unimplemented A-trap error on PowerBook 100 with System 6.0.4 for the QDError() ToolBox call.

- Changes to compile with StuffIt Engine SDK 4.0v4.

- Option-Command About IM/Mac did not do what it announced.

- Solved a potential bus error while updating (command-U) the inbound mail window.

- Changed the first uppercase 'T' of '(This file must be converted with BinHex 4.0)' if present in a reply to a lowercase 't' to help Eudora to not try and decode incomplete files.

- PC or UNIX style text gets line feed characters stripped/converted when drag and dropped into the Message Entry window.

- Added a 're-open application' Apple event. The Mac OS 8 Finder sends a 're-open application' Apple event ('rapp') to applications when the application is already running and it is opened from one of the Finder's windows (either by a double click or by selecting the application and choosing the Open command).

- Now also decodes selfextracting archives.

- The default button in a dialog was not outlined with RGB gray when inactive but rather the old QuickDraw gray pattern.

- Checked compiling with MetroWerks CodeWarrior Pro 2.

- StuffIt library was not unloaded after use.

- The small horizontal line in the 'Send' dialog was drawn with the old QuickDraw gray pattern instead of RGB gray.

Sunday, February 22, 1998 - 15:08:51

PS (by PA2AGA)

This version obsoletes all versions of info-mac/comm/radio-im-mac in the Sumex-Aim.stanford.edu archives.

The new IM/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.

Right, I'd say I'm glad to belong to the technology aware Ham community,
the arguments are generally based on rational physical reasons and this
is the kind of discussion I like. As opposed to the kind of discussion
some people have when arguing about the last soccer match and giving
exclusively subjective arguments (they seem to know it, and they seem
to like it).

Though I noticed in this thread some "mine's bigger" arguments, tssk, tssk...

Economy of scale, in various ways. You can get more efficiency
in a power station running at a constant and predictable average power
than in a domestic heater cycling on and off. Wherever you burn the gas it
will produce the same amount of pollution, but if the process is inefficient
you need to burn more. But it's *not* simply to produce *heat and light*
somewhere else: when was the last time you saw a gas-powered vacuum cleaner?

The hydrogen fuel cell is quite amazing, but as Walt puts it nicely,

Duh! A bit confusing!

The concept fuel cell is working fine in Australia and there are a
number of websites carrying info on hydrogen fuel cells but I wonder how
much the petroleum companies would like that be put to bed!

The problem with all fossil fuels in the release of CO2 that was fixated
from the atmosphere millions of years ago in the plants and animals that
ended up as crude. We are currently releasing it much faster than it was
fixed in the first place and thats the problem.

Dunno if the hydrogen cell will ever take off but its a start!

True - but most diesel cars have bigger engines/turbos than petrol

>3. Diesel engines are harder to start in cold weather,

Wrong, thats why they have heaters! My landrover at work starts day in
day out without a problem and thats in some of the worst weather in the
country!

>4. Diesel fuel here costs about the same as gasoline

Cheaper here

>5. Diesel engines are generally noisier than gas ones.

Not true. Modern diesels are just as noisey as a 5 year old average
family saloon. And having seen some of the wrecks wandering around here,
better! Can't say my landrover is quieter though! But I would like to
see your family saloon climb a 3000ft mountain road in winter!

>
>I suspect point 4 is the deciding one, though.

I have changed over to diesel in the UK because of the cost. I believe
recent figures show an upward trend in EU towards diesel.

Natural gas is lead free! Its mostly a a mixture of methane and ethane,
it burns cleanly with minimal sulphur emssions (0.7 mg per Mjoule
compared to 910 mg for coal)

The coal gasification process that was used for town gas was terrible!
It was full of horrors and thats one of the reasons for its demise! It
wasn't really cleaner than coal but seemed that way at the time!

Reserves sizes are never fixed because:

1. Better technology to discover/exploit reserves
2. Increased price = increased profits = more investment for 1.
3. Technology increases allow exploitation of lower grade ores etc
4. Third world countries now cashing in physical resources

BTW current 'mineable' world reserves are estimated at 500 years, not
unless you want to start digging up areas of national parks etc and the
US has approx 26% of world totals giving you something around 100 years.
Certainly not the 1000 years you estimate. You are correct in the
reducing useage of coal. But only until that becomes too expensive to
mine, or the environmentalists get you!
>
>If anyone seriously cared about the environment, we'd stop greenhouse

Yep thats right good old nuclear. What is it about americans and their
fixation with atomic anything. Its not just a few hundred pounds of hot
stuff either, its thousands upon thousands of kilos of lowgrade waste

like clothing/tools etc that need to be disposed of. And then what about the stations when they reach the end of their life, you going to bury that as well! sic. We already have enough waste to worry about. Oh and atomic energy is safe? 3 mile island and Chernobyl prove that its not and when things go wrong - as they do - then you end up contaminating billions of sqaure kilometres. Some farmers in the highlands and lakes are still not allow to sell lamb because of the high levels of Strontium 90 in the meat, caused by Chernobyl fallout.

>
>But that won't happen because 1 in 7 jobs revolves around fossil fuel
>production, distribution, and consumption. There's too much money
>and too much vested interest in keeping that system going to its last
>gasp.

Agreed.

But the US don't want to do anything about it. The 1992 earth summit proved that. The Bush administration of that time attempted to torpedoe the whole damm thing by vetoing adoption of targets and timetables for CO2 reductions even though studies showed that it was easily met. They even embarressed Willaim Reily - the US delegate - by leaking his memo to Bush saying that they could easily meet the target and could he agree to the CO2 and Biodiversity treaties.

Your latest government is pretty much of the same.

Instead of looking at nuclear/fossil fuels - we need to be looking at renewables, wind/wave/tidal/solar/biomass. They all have their own problems (environmental too) but they can cut global warming by reducing CO2/NO2/SO2 emissions. No power source can at the moment be perfect but we can improve matters, it just needs co-operation and governmental agreements, something which does not seem to happen from your side of the pond

What is a gallon ;-) Fuel in Europe is measured in litres these days. Though many motorists still try to work out how many miles they get from a gallon of fuel.

A local petrol and diesel station, has eight pumps, six having either petrol or diesel. The other two being exclusively diesel, intended for truck filling, with large hoses and fast pumps. It gets a bit crowded when two or three trucks pull in at the same time ;-)

:
:

The sales tax on various "necessities" like food is often less than
the "full" sales tax, depending on your location. The ranges for sales
tax that I've seen around the US range from about 4% to 8.5%. In some
cases, there are additional exemptions; in my county, for example,
there is no tax at all on clothing for a week prior to the start of
each new school semester - not only for "Childrens" clothes, but also
for any "work" clothes like uniforms, work boots, suits, etc.

1 and 2 are rubbish. Do you believe everything you
read in the press?

3 Not here. If you choose to live in the freezer,
that's your problem.

4 As here in UK, but not so in the rest of Europe
where diesel is considerably cheaper.

5 Granted. Slightly more noisy.

This isn't North America. We don't _have_ to do everything
you Yanks do.

We don't have the capacity to support all the great unwashed
being on-line 24+ hours a day. I'd rather pay for local calls
(which are dirt cheap anyway) than suffer the problems caused
by under capacity at the telephone- and ISP-levels.

I noticed this insidious practice in Austria. You bought
food in the Konsum supermarket at only very hilarious
prices, then they added the VAT at the till, at a flat
rate, to render the prices extremely hilarious.

They also have a system where you pay telephone charges
whether your call was effective or not.

Ah, you get that also. I recall ordering a bottle of Loewenbrau in
Atlanta 20 years ago and thinking I had received something from a bad
batch until I looked at the label and saw it was brewed here in the
states.

Caveat emptor.

> >>how very little fundamental knowledge is really NEW!

True, octane doesn't give a measure of raw power of 1 gallon of gas, but it does determine how much use a gasoline internal combustion engine can get out of it. If you try getting the same horsepower from two fuels of different octane, but gasoline all the same, you are going to fry or blow holes in your pistons, not to mention crack heads and blow cylinder gaskets, and even wrinkle rods and bend crankshafts. Detonation cannot be tolerated, so to up the power of a gasoline engine, you MUST run higher octane. Sure you have detonation sensors, but all they do is back the timing (aka power) off until a safe level of detonation is achieved. Detonation sensors therefore allow more power for a given amount of gas under certain conditions, but not that much. They are also required hardware in a turbo motor (gasoline types).

But turn production up to the level needed for enough batteries to keep the world in cars, and the small percentage margins from those mines will grow with the increased mining. Then you have processing, battery assembly, dead batteries that somehow missed the recycling center, etc.....

I'd much rather have a plutonium breeder reactor literally in my backyard (these are capable of supercritical bomb masses on meltdown, for the uninformed), than a lead anything plant 20 miles away.

If there is a good road, why not? Most luxury cars are built well here in the USA. If there quality isn't even always up to par, typically the power still is, and since Japan scared the crud out of the American manufacturers, America has even got its quality back up ....

In the case of the one I own, it's very reliable and starts first time after being locked away for many months (as I hope to prove again in early April) because it is a relatively simple engine compared with most modern petrol cars. Also mine is particularly safe and comfortable, and is neither noisy nor underpowered. I guess that Gary gave up on diesels without trying one with a turbo engine.

Dear Fellow UCSD List Server Users,

As an UCSD Alumnus, I have been taken aback by the recent abuse of these lists. I was relieved to see that the primary offender (Mr./Ms. Randeep Bhopal) apparently is a student at a university site in the UK, not a UCSD student.

If the UCSD mail list administrator(s) reads this, I would hope that the administrator at 'shu.ac.uk' could be reached and a request made to discontinue Mr./Ms. Bhopal's internet access.

If this does not or can not happen, and Mr./Ms. Bhopal continues to fill our inboxes with inappropriate postings I would like to recommend the following:

Each of us on each list he/she posts to reply's ONLY to him/her, requesting the discontinuance of his/her inappropriate behavior. We can only hope that several hundred emails will get the message through.

One other option would be for the list administrator(s) to release to all lists the email addresses of the postmaster at 'shu.ac.uk' and or the Dean of Mr./Ms. Bhopal's department, that way we can fill their boxes with recommendations regarding Mr./Ms. Bhopal's behavior.

(Mr./Ms. Bhopal: you were sent this in the hope that you will see the error in your ways and correct you behavior yourself.)

Regards to all,

Ralph G. Sbragia, CHST

I justify the big engines because we drive big vehicles, and they need
that power to give them decent performance. As to the bushwa about
fossil fuel consumption and CO2 production, I'm simply not as alarmed
by it as you seem to be. Take a *hard* look at the science behind some
of this. It is shockingly shoddy and agenda driven.

>>a pair
>>of them go nicely under a 4x4 pickup (which our government just informed
>>us in a backhanded way is 25 times less likely to result in a fatality for its

>
>And maybe 50 times more likely to kill the guy you run into?

If he's driving some little crackerbox on wheels, probably. That's
his decision and his tough luck isn't it? Physics won't be denied.
It is not the fall that kills you, it is the sudden stop at the end. The
same goes in a collision. Big iron doesn't stop as fast in an impact,
even a rigid barrier impact, so the decceleration forces on the
passengers are much less than they are for a light vehicle. (A
very surprisingly *large* difference, do the math.)

The larger crush space and sturdier construction also limit
intrusion into the passenger compartment by external objects
intent on doing you bodily harm. If you choose to save a few
pennies in fuel consumption in preference to crash worthiness
and occupant safety, well I suppose that's your choice to make.
But there is a price to be paid for that choice, and that price is
yours to pay in blood.

>>There are good reasons why
>>we like to drive heavy iron besides the fact that it makes a wonderful
>>counterpoise for our HF antennas.

>
>For example, the penile extension syndrome?

There is certainly an element of macho in driving a 4x4
that never leaves pavement. But in fact mine does leave
the pavement frequently enough to justify it, or has to
operate on pavement slick enough to justify it. And it is
large enough to carry the loads I occasionally need to
haul, as well as big and sturdy enough to offer me a
degree of protection in traffic mishaps. Those are all
things which have to be balanced against operational
costs like fuel consumption.

I've owned the little crackerboxes. I've raced everything
from MX motorcycles to Top Fuel dragsters. I think I
understand the tradeoffs involved between agility and
survivability. And for my day to day driving, I've chosen
the big iron as best making the tradeoffs I'm willing to
accept at this point in my life. The hard fact is that you
can't avoid all collisions, no matter how good you are
or how agile your vehicle. Crashes happen. And when
they do, the vehicle you chose can determine whether
you walk away with a few bruises, or whether they have
to pry you out of the tin can and spread you in the
coffin with a pastry knife.

>natural resources, doesn't it.

Most British motorists probably don't drive 500 miles a week either,
but many of us have to drive that far or further every week. We can
easily do that on one tank of fuel. And who told you natural resources
are scarce. I have 4 oil wells on my property that are currently idle
because the oil glut has driven prices down lower than I will accept.

There have been predictions that we're imminently going to run out of
fuel throughout this century. None of them have come true. If you examine
them closely, every one has sticky fingers on it somewhere because
someone thought that they could profit from scaremongering. (Oil
companies or environmental activists, both profit from scaremongering.)

Years ago, I worked for a drilling company. I saw the logs of supposedly
dry holes which were anything but dry. This market has been manipulated
since day one. If you want to get an inkling of the *true* extent of our
resources, read your Dr Thomas Gold's book "Power from the Earth". It
comes quite close to the mark in a number of areas. Oil and gas aren't
really dinosaur farts, despite popular opinion to the contrary. We've
only scratched the surface of the resources that are available to us.

>>The diesel car market wasn't large in any

>
>No longer true. You should try some of the latest diesel-powered cars
>now available on the European market. They will equal any "gasoline"
>powered car in terms of performance, quiet running and fuel economy.

Well, I mentioned that I have driven the new Chevy pickup with the
Cummins 6.5 liter turbo diesel. It is quiet compared to diesels of
the past, and it is reasonably economical (even given the higher
pump price of diesel). It has power, but it isn't responsive to the

throttle the way a gasoline engine is. A 5 liter V8 gas engine still performs better in terms of responsiveness, but the diesel does do an excellent job when towing a load.

All of my farm equipment has been diesel powered for decades. It pulls well, and the extra mass is not a drawback in a farm tractor where it gives better traction. The more frequent maintenance required by the diesel isn't a real burden either because the conditions are so dusty that the gas engines need frequent maintenance too.

But in our traffic, quick acceleration and responsiveness to the throttle are a must. And the diesel just can't match the gasoline engine there. The six times less frequent need for oil changes of the gasoline engine is also not an inconsequental matter in a vehicle you need for daily transportation. (Not so much in terms of cost, but in terms of time lost getting it serviced.) We now have gas engines available whose first scheduled service is at 100,000 miles, though they aren't widely deployed yet. That means for the average driver, their vehicle won't need service but once every 3 years. Most engines in use still need service every 12,000 miles. Because of blowby contamination, diesels need service every 2,000 miles.

>billions of sqaure kilometres. Some farmers in the highlands and lakes
>are still not allow to sell lamb because of the high levels of Strontium
>90 in the meat, caused by Chernobyl fallout.

TMI proved that our plant designs are safe, even in the face of the
operators doing exactly all the wrong things for 48 hours. The Detroit
Edison Fermi plant meltdown was even better proof. That was a total
core melt, not just some core cladding damage. Not one person
was injured. What Chernobyl proved is that you don't build a reactor
with a positive void coefficient and then call a tin roof a containment
structure.

Low grade waste can be dealt with by concentrating it into high grade
waste. The entire amount of spent fuel used by the world's nuclear
programs to date could be held on a football field stacked to a depth
of 4 feet (though that wouldn't be a great idea to actually do). If you
throw in all the waste from other sources from day one (except weapons
programs), including dismantled decommissioned reactor plants, it
would still make a pile smaller than the ash pile generated by *one*
1000 MWE coal fired plant in a year. The volume of waste is simply
not huge. Virtually all of it could simply be piled in a desert and have
a fence placed around it without any serious consequence. The
greatest bulk of the high level waste is short lived radioisotopes.
In 100 years, its activity is down to the level of the ore originally
dug out of the ground. It is not necessary to isolate it from the
environment for all time.

Right. The US isn't going to agree to anything which makes us
non-competitive for no good reason. We have a high energy society,
and that is our advantage. We aren't going to give it up without
overwhelming proof that not doing so would be devastating. So far,
the proof isn't even self-consistent or mildly compelling. Much of
it is downright dubious speculation.

>Instead of looking at nuclear/fossil fuels - we need to be looking at
>renewables, wind/wave/tidal/solar/biomass. They all have their own

>CO2/NO2/SO2 emissions. No power source can at the moment be perfect but
>we can improve matters, it just needs co-operation and governmental
>agreements, something which does not seem to happen from your side of
>the pond

Renewables do have serious problems. The most serious being that
most of them are very diffuse. In the US, we have tapped virtually all
the hydro we're ever going to be able to tap. And much of that will be
lost in coming years as the reservoirs silt up. Hydro is best used as
peaking power anyway, and not as base load generation. It is rapidly
and arbitrarily scheduleable on demand.

Tidal power is very site specific as to where it can be economically
exploited, and we have few such sites. It is also intermittant. So it is
not suited to meeting our on demand peaking needs. If we allow it
to take up some of the base load, we have to throttle back our other
base load sources to accomodate it at the times it is available, and
that generally means that they will be operating very inefficiently.
Base load generation should generally be run flat out at its most
efficient output all the time.

Wave power is too diffuse to be economic, and too vulnerable to
weather. It is also too far from most of our continential demand.
We have some promising wind sites, but not that many. The bulk
of our wind energy resource is diffuse and irregular. It isn't suited
to meet base load, nor is it scheduleable to meet peaking demand.

A large grid can allevate the problems of wind being a diffuse and
irregular source by averaging the resource over a large area. But
such a grid is very unstable and very difficult to manage and
control. As long as wind provides only a tiny fraction of the grid's
production, it can be managed. But if it starts to become a significant
supply source, the grid becomes very unstable and subject to
wild surges. That's particularly true when major storm fronts
pass through our prime wind farm areas, as they do regularly.

Solar suffers from LOLI (nuke speak for Loss of Light Incidents).
When we need power the most, at night, solar fails us. It is also
a diffuse resource, requiring vast stretches of land to provide
serious amounts of power. But it is perhaps the best of the
available renewable energy sources. All the other renewables
ultimately are secondary solar energy. (Actually, renewable is
a misnomer, the nuclear fusion supplying the energy isn't
renewable, but it is for practical purposes virtually inexhaustable.)

Right now, gathering solar for grid power simply isn't economic,
but that may change with improving technology. Storage will be a
necessity, however, due to LOLI. Pumped storage is perhaps the
best we have available for this, but it is very environmentally
unfriendly.

Biomass is ultimately no different than fossil. It releases CO2,
and a host of other pollutants, which are not immediately
recycled or neutralized. And in some cases biomass doesn't
even represent a net energy gain. For example our gasohol
program, which fermented and distilled corn to make fuel
alcohols to be blended with gasoline, wound up being a
net fossil fuel consumer due to the use of petrochemical
fertilizers and fuels needed to grow, harvest, and process
the corn to alcohol.

I note that you haven't touched on one of the more promising
alternative energy sources. That's dry geothermal. The resource
is huge, and we have the drilling technology to tap it. It is non-renewable
in the sense that the nuclear fission which powers it is not breeding
more fuel, but again, like solar fusion, the fission resource is extremely
large and for practical purposes inexhaustable. Dry geothermal is a
promising source of base load generation.

But we will still need large central generation plants that are fully
scheduleable and able to meet base load demands. The best
technology we have for that is the nuclear fission generating
plant. It is the cleanest and lowest cost source of electrical
power we know how to produce. (Actual costs, not politically
imposed hysteria costs.)

Gary,

Inexpensive Spread Spectrum radio modems are available off-the-shelf for
the unlicensed ISM (Industrial/Scientific/Medical) bands. The base
station would cost under $1000, and the remote stations, under $300.
This gives you 128 Kbps async multipoint connections.

The nice thing is that since they're in the unlicenced band, you can run
full internet access through them. I'm going to set up an ISP using
them very shortly here in St. Louis.

1089. G3RUH fsk vs CDMA ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-26 00:00:00 UTC
From: parnoul@gaap.saclay.cea.fr
Message-ID: <6d3ekj$4so$1@news.cea.fr>
Source record: 25254

Hi there,

I was wondering whether the well known scrambling technique used in
the G3RUH fsk modulation standard was ever close to the CDMA
cellular phones air standard ?

The "Exoring" of the digital data stream with the output of a pseudo
random sequence generator seem similar in both standards, would
the modification of the pseudo random sequence (code ?) of the
G3RUH modem allow two (or more) transmissions on the same frequency ?

Modifying the 17 stages generator of the G3RUH is easy (the grapes
modem uses another intermediate tap location), decoding two or
more transmissions would probably need some DSP correlation technique.

What do you think ?

I certainly was not around in 1954! That would make me 44, a
terrifying thought.

No. The scramblers in the G3RUH and WA4DSY modems run at the
data bit rate. So there is no spreading of the spectrum outside the
baseband bandwidth. The purpose of these scramblers is to "whiten"
the baseband signal so that it isn't biased by an excess of 1s or 0s.
There is no process gain.

In direct sequence SS, the PN noise is at a high multiple of the bit rate.
This does spread the signal outside the baseband bandwidth. It is this
spreading which allows multiple signals to share the same spectrum.
The ratio of baseband bandwidth to spreading bandwidth is the process
gain of SS. It is this process gain which allows the separation of two or
more signals spread across the same bandwidth. In other words, if the
spreading ratio is 10:1, there will be up to a 10 db separation between
a signal on one sequence and a signal on another sequence sharing the
same spread bandwidth when despreading is done. This allows them to
be separated in the receiver.

1936, and the BBC had to use Philo Farnsworth's camera, cause theirs
didn't work. Farnsworth's whole system pretty much made Baird throw
in the towel.

The early US systems were 400some lines. The horizontal sweep derived
high voltage must have come after they went to 525, because at 12 kHz,
the flyback squeal would have driven everybody nuts.

You may be suprised, but there are plants on the board right now, that if implemented, can come pretty near 100% safe/100% leak free. And in America, they most likely will end up implemented. Now, getting rid of gas powered cars is going to be another thing entirely. No batteries can yet match the storage capacity per pound of a gallon of 93 octane gas. If they did, I would drive an electric car, but until I have enough power to waste power in my car, I'm not driving a boring electric one, maybe thats just an American thing, but hey, I am what I am. I also will NOT support lead acid battery powered car efforts. I'd rather breathe ash, deal with green house effects, or absorb nuclear radiation than deal with the lead that ends up leaking out from lead acid battery production once it ramps up to the levels necessary to build batteries for every car that will ever be manufactured. At least of I die from ash, green house gases, or nuclear radiation, I'll have my mental faculties until I am too debilitated for it to matter, with lead, that isn't an option.

Just my view,

David

What we really out of gasoline are ALL the additives, that way we can go
back to the early vapour carb's patented ideas, reduce emissions to the
high 90's level and get 100-200MPG.
Fat chance.

Three Mile Island (TMI) was a testament to the safety measures
built-in to the US reactors (Soviet reactors are a different story).
The operators at TMI (unknowingly) pretty much did everything they
possibly could have WRONG! Three times the emergency reactor fill
systems were initiated by automatic control and all three times they
manually shut them off! When a steam bubble was forming in the
reactor core, they vented coolant (instead of adding more)!

Still with all this blundering, very little (estimated--might be none)
contamination was released to the outside. When the core suffered
severe fuel element failure, the containment dome sealed itself as it
should (thank God they didn't override that). The Zirconium and
Hafnium core materials (as opposed to graphite in Soviet reactors)
held up to the extreme temperatures sustained within the core and
prevented further fission.

The main problem with Nuclear Power (in the US) is that the technology
is still classified (By the Atomic Energy Act of 1957) and because of
this, the general public has no idea how safe it really is. Only
Three Americans have every been killed related to Nuclear Power. The
conventional plants can't make a claim like that.

Well Walt, that must be your fault. It's generally a bigoted comment from
yourself about G-Nothings, G7s, repeater users, ex-CBers, the "guess-tick"
RAE et al that sparks things off.

If the farts on 80m are that old, why is it "80 metres" not 260ft?

Nick
(a G7, ex-CBer but NOT a repeater user)

Might be where you have high prices anyway - diesel locally has always
been 3 - 4p /ltr cheaper! Hence the purchase of a landrover discovery!

Current price is 59.9p/ltr against 63.9p and 64.9p ltr in two local
emporiums.

Yes, I've been keeping up with this market, though it is very different from
a Part 97 market, and isn't directly applicable to amateur radio. Now what
sort of range do you expect from these stations without highly directional
antennas over non-line of sight paths? In other words, how well do they get
out in real suburban conditions? And how well does the base unit stand up
to operation at a high RF site?

From what I've been able to determine, average range unit to unit is on
the order of a mile in suburban terrain without either towers or high gain
directional antennas. And from what I've experienced, they fold up under
the high RF present at high relay sites. Both factors make them unsuited
for use in the very sparse topology of amateur networks.

>The nice thing is that since they're in the unlicenced band, you can run

Good luck. Keep us posted with your real world experiences attempting
to do this.

>> The only thing SS brings to the table that we need is the ability to share
>> spectrum.
>

>How about noise immunity, security, etc?

SS doesn't bring special noise immunity (other than against coherent or narrowband noise sources, IE interference, and that is irrelevant to our upper UHF operations where there are virtually no other signal sources within line of sight). Security is not something amateurs need be concerned about. All of our transmissions are to be in the clear according to Part 97.

Note that SS is a good technology, but I am looking at it specifically in regard to its viability for amateur radio use under Part 97 on our largely untenanted upper UHF bands. As best I can judge, it costs more and delivers less for those purposes than does ordinary wideband FSK.
On our busier VHF and HF bands it would be another story, but Part 97 doesn't let us use it there.

Er, one small point. In Scotland (and no doubt many other parts of the
UK) there are villages where there were lead mines until the very recent
past.

The locals don't seem peculiar in any way; and the many tourist visitors
to the insides of the mines would appear to be there voluntarily.

Why in the name of all things Usenet are we *still* using this topic for a thread about 100 messages long that hasn't talked about Internet messaging for the last 97 or so, and has varied from TCP/IP vs. AX.25 on packet to 56k TNC's to American beer vs European beer to petrol, gasoline, hydrogen, biscuits and cookies, outlawing diesel fuel, and nuclear power plants exploding?
Time for a new topic thread I think...

Aww, go ahead and flame me, why the hell not! This is entertaining at any rate!

Nothing is 100% safe, but you're in much greater danger of slipping
and falling in your tub than you are from a nuclear power plant literally
in your backyard. And one hell of a lot safer than if you have a coal
fired plant in your backyard. The US nuclear power industry has the
best industrial safety record of any industry. There have only been 3
nuclear related fatalities in the entire history of the US nuclear power
program (and those didn't occur in an operating plant). And that's even
in the face of some horrendous operator foul ups. TMI is an example
where the operators did everyhing wrong (and not just wrong, but the
worst possible wrong that they could do), again and again, yet no one
was injured (except the poor reactor core itself).

Our reactor designs are safe. Even a core melt causes no injury to the
public. But our current designs can injure themselves, and that can
have financial consequences. Now our reactors depend on active
systems for proper operation. Those are layered in depth against
failures, and backed by passive containments if *all* of the active
systems fail, but the reactor can still damage itself.

It is possible to make reactors which are inherently safe. With them,
the worst that can happen is an unexpected plant shutdown if something
should fail or be improperly operated. The shutdown would occur entirely
via the laws of physics, no operator intervention or active systems are
required. No damage to the core would occur, and an ordinary re-start
would have you back in operation. We know that this works. The laws of
physics guarantee it, and it has been tested.

(Basically, with an inhrently safe design, you have to actively do
everything just right to keep the reactor critical. If you quit doing
any of it, the reactor quits too. And if you try to overdrive the reactor,
it goes sub-critical too. If you lose cooling, the reactor shuts down, etc.
It is only capable of operation in the safe range, and there's nothing
you can do short of radically redesigning it to change that.)

Now the nuclear weapons program is a different story. There has
been a significant lack of care exercised in some parts of that
program. But it is unfair to taint the civilian nuclear power program
by lumping it with that of the military. Our objectives are different
and our plants are different. We don't try to combine power generation
with weapons grade military production as is done in some countries.
That can have risks.

>
Hey, this makes very much sense to me, for sure, if every single bit is
transmitted sequentially on -say- 10 different frequencies, more chances
are that the receiver can recover the bits from the others "random" noise.

So the direct sequence PN noise also "whitens" the baseband signal, to
a larger extend of course.

BTW, I wonder how the PN sequences can be synchronized at the reception
end, in the case of the G3RUH scrambling for instance : is the sequence
going over the 2**17 bits (13 seconds @ 9600 bauds) OR is the generator
resetted at each HDLC flag and only going over the few milliseconds of
its beginning ?

Thanks for the info Gary,

IMO, the greatest potential for amateur spread spectrum in the practically empty UHF and microwave band is the avoidance of multipath problems. When the frequency is varied, so is the wavelength. The path length, measured in wavelengths, is different for each frequency and the pattern of constructive and destructive interference between the direct signal and reflected signals is different for each transmitted frequency. When transmitted on multiple frequencies, some frequencies suffer destructive interference and the signal drops into noise, but usually some frequencies get through and the data can be recovered. This is very important for fixed (or nearly fixed paths) when the interference pattern is fixed or slowly varying. According to Murphy, the antenna gets always installed at the signal null :-).

If the other station is mobile, the destructive interference pattern constantly varies and the signal drop-outs can be compensated with interleaved forward error correction.

Yup, it is what is advertised, though Gary mentionned earlier that his
tests using Part15 (?) devices nevertheless suffered from "nulls", points
in time and space when no signal is received, when a fraction of a second
later or 10 cm further the signal rushes back...
Is part 15 devices direct sequence SS ?

I was mentionning the ability of receiving the digital signal of every
single transmitter operating on the same band at the same time as far
as their signal strength is about the same. This is what CDMA cellular
technology is supposed to do, the quality of each digital transmission
being progressively degraded as more CDMA phones are accessing the same
cell. If memory serves, they talk about 10 digital links when the GSM
TDMA allows 3 links (in a smaller bandwidth though).
The output power of each CDMA phone should be precisely servoed in
order to honor the signal strength constraint mentionned.

Would amateur radio take benefit of this multiple access on the same
band, probably yes.

As has been stated before, spread-spectrum radios aren't a panacea.
If you want noise immunity, well, some tests down in Texas showed that they
died in the presence of strong in-band signals. And, if you want
security - you're not going to get that, in the amateur service, by
definition. At the last DCC, in fact, there was a student paper
presented that outlined a technique to isolate and track a given SS
signal.

Amazing what you can pick up at the TAPR DCC. :-)

Hi :

I'm looking at getting into Pactor on HF. What I have read indicates that the convention is the PACTOR operation uses LSB. Is this convention applied to all of the HF bands? As most of you know, the phone operating convention is to use USB on 20M-10M. This is a concern for me as I just realized that unlike most HF rigs with phone capability, mine (Ten-Tec Argo 556 - QRP little brother of the Scout) doesn't have a reverse sideband switch, so I many be limited to 80M-30M.

Thanks

Pactor, RTTY, and Amtor all use LSB or FSK if your radio is capable on the ham bands 80-10m.

Beats arguging about who said whhat. And at least it shows some of us
are capable of debating without threatening nasties on each other. I
would say its nice to see that sane thinking people do have some
interesting views and its REALLY helping me with my studies this year!
Keep going guys (and gals if there is any)

BTW do we have any YL's on this NG?

1129. Re: LSB used for PACTOR on all HF bands??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-02-27 00:00:00 UTC
From: "Peter A. Klein" <pklein@seattleu.edu>
Message-ID: <Pine.GSO.3.95.980227095756.23234B-100000@mozart2.seattleu.edu>
Source record: 25199

The convention is to use LSB, but for Pactor, it doesn't matter. Pactor reverses the mark/space sense of each successive packet. So you will be able to run Pactor on 20m and higher, using USB. but your tuning dial will show a slightly different frequency than the other operator. Unless you're trying to connect to a BBS, it won't matter.

If you also want to use RTTY and AMTOR, you will have to reverse the mark/space sense of both transmit and receive on the bands that use USB. Most TNCs can do this.

What? Have you ever been to Leadhills?

Many hundreds of miners and their families died from lead poisoning and
the lead fumes from the smelters polluted the areas for miles around the
plant. In fact some of the smelters still exist because the lead has
leached its way into the wooden building in such quantities that it will
not rot. The local watercourse is heavily contaminated by lead sulphide
and in most places around the site; lifeless.

The expose now is probably minute, the ore is not mined now (although
there are tonnes of ore left - supply/demand price too low for mining
it) and so the Galena is not being spread about. The smelters are no
longer running and so lead fumes are not being produced, so of course
the locals look OK. But their ancestors were far from OK.Most died very
premature and quite nasty deaths, brought on by lead poisoning.

PACTOR is like packet in that it is only the state transitions which matter,
not their sense. So you can use either sideband equally well. With RTTY
or AMTOR, you'd have to reverse sense in the TU as well if you tried to
use the opposite sideband. The only practical effect of using USB instead
of LSB for PACTOR is that your dial will indicate a different frequency
from that of a station using LSB.

I've used LSB for all digital HF modes (RTTY, PACTOR, etc.). I understand that LSB/USB for PACTOR is not a factor, but don't know why. Maybe someone else on the group can give you a better explanation.

With pactor as a mode, it's not a real problem, since other stations
will still be able to decode you and you them. It's not polarity dependent
like Amtor for example. I also note that pactor is a 100% duty mode,
be sure your finals can take the constant usage. Finally if you are
interested in rtty or one of the other digital modes with the Ten Tec,
most of the controllers have the ability to invert the signal to accomodate
your rig.

A couple days ago I came across a post from someone who had connected a TNC to his Kenwood ts570d. I had a couple questions, since I plan to do this in the not too distant future.
1) Which lines do you need? Do you neet the PTT or can transmit be done using the vox?
2) What's the trick to opening the supplied connector to make the connections?
Any help would be appreciated.

We've had at least three which "blew". Two suffered core melts
and one coughed its pressure vessel header. No off site releases
of any significance occurred in any of them. Our containment
designs are good.

>>
>>73, Bob, VE7HS

>Why not? If the fuel is cheaper and the engines available.

Because the fuel ISN'T cheaper, and the engines are more expensive to buy
and service. Opting for diesel simply isn't cost effective. Here, anyway.

73, Bob.

-----BEGIN PGP SIGNED MESSAGE-----

I have a KAM unit that I've purchased in the early
1980's. I've upgraded it about 4 times and now it is
the KAM "enhanced" unit. functionally about the
same as the KAM+.

The KAM's have some nice features for RTTY and have
been avid into RTTY between 1982 and 1996.

Of the nice things about the KAM are:
- mark and space tones can be set independantly in 1 Hz
increments. (set shift=modem). I like setting
mark=1000 hz and space=1170 hz as it is much easier on
the ears when conversing in data modes when wanting
to actually monitor what is being sent and received
via a speaker.

- Shift can also be manually set to whatever you want
(withing rational limits of course)

- If you get a KAM+, you also get GTOR (Golay-encoded TOR)
GTOR is my favorite mode as it has 100, 200, and 300 baud
transfer rates and will adapt to circuit conditions, shifting
to a slower baud rate if the path degrades, and shifting to
higher speeds as the circuit path improves. (Pactor only
has 100 and 200 baud) ..

> Maybe I am not listining to the right frequencies.

Typically: Pactor between 65 & 80 kHz above the band edge(Not too
much amtor left, but it'd be in the same spot); RTTY from about 80 to
95 kHz above the band edge. That's true for all bands except 80 I
think; they're up higher, around 3625 kHz.

Can't help you with fax. Pretty sure the sstv frequencies are up in
the voice part of the band.

HTH some...

I bought the MFJ1278b (new) at a hamfest 2 weeks ago to use with a Kenwood TS440s and a Yaesu FT2400H (2 mter).

I've been a ham for 22+ years as a hobby (I'm not in electronics by training or profession), but I've had me share of hands on electronic tinkering. The documentation manuals for the MFJ1278b are the worst I've ever seen for electronic equipment. I'll concede that with the array of HF or VHF equipment or computers available, it's not an easy task to put together a manual that'll work for everyone all the time, BUT, I'm using mainstream computer (IBM PC) and ham radio gear. The manual is vague at best, and flat out wrong in a few instances on basic wiring and cable wiring instructions. I will be happy to be more specific on these errors if you request.

The MFJ unit seems to work well on HF, but I don't yet have it wired for VHF due to difficulty finding a pinout scheme for my VHF xcvr.

SUMMARY: The hardware seems okay, but the manual and hooking-it-up process is unreasonably trecherous.

Not really. We had a message store-and-forwarding system, and that's
about it. The opportunities that a real network provides are
substantially greater - digital voice, video, web access, etc.

Most of the family cars here in California are 4 wheel drive utility vehicles or 4 x 4 pick up trucks and easily capable of climbing a small 3000 feet hill. Sixty percent of new car sales are now this type of vehicle. These vehicles get wonderful gas mileage, anywhere from 12 to 20 mpg. They are also much safer to drive, you can actually rear end someone in a compact (comparable to a full size UK car) vehicle, drive over the top of them and continue on your way with out too much trouble. You pay the same insurance rate as on a compact vehicle, so all in all good value for money. There is also plenty of room for an array of Ham Radio equipment and antennas. I added the last sentence just to be legal in the news group. To post to this group I think that one should be required to mention something about radio, no matter how trivial or remote this may be.

It is instructive to note that in the outdoor case, the required spreading
bandwidth is *less than* the modulation bandwidth of most narrowband
systems, IE 70 kHz for the WA4DSY 56 kb modem. This results in symbol
distortion due to *selective* fading.

Correct, interleaving gives us time diversity, which can be just as useful
as space or frequency diversity, and is generally less costly to implement.

>aren't all stations intended receivers, since they must know when it
>is safe to transmit ?

That's the rub, which receiver do you pick to be the one with the
23 db Eb/No? If it is the one furtherest from you, your signals will
be much stronger than that at all other receivers. Meanwhile, another
transmitter at another location will be putting a different signal strength
into the receivers. With multiple transmitters and receivers dispersed
over a geographic area, this leads to an intractable near/far problem
for signal leveling.

Cellular avoids most of that by using a constrained hub/spoke
topology with carefully coordinated cell sites. This is very similar,
on a smaller scale, to traditional high site repeater type operation
with geographic coordination between repeater sites. This is the
same as we do today with narrowband systems. We buy nothing
in terms of lack of need for coordination by going with SS.

A useful analogy to this situation is operating your HT at the Dayton
hamvention. FM capture can play the role of SS spreading sequences
for the purposes of this analogy. If you try to talk to your friend at the
other end of the fleamarket, you have to use enough power to capture
his receiver. But in doing so, you capture the receivers of every other
HT in your side of the fleamarket, disrupting their communications.
And someone standing next to your friend can transmit at low power
and disrupt your communications with him. It is a near/far situation.

Now if there is another fleamarket going on in Middletown at the same
time, people there can reuse the same frequencies because FM capture

will be sufficient to let them operate over the din at Dayton, and vice versa. This is geographic coordination. But what happens if someone at the Dayton fleamarket has just bought a surplus VHF kW and decides to try to talk to *his* friend in Middletown. Everyone at Dayton is wiped out, and the friend in Middletown may still not be able to understand the transmission if someone is standing a few feet away using a HT on the frequency. Near/far again.

The basic problem is that propagation path losses in a dispersed geographic system can vary by 80 db or so with respect to any arbitrarily selected transmitter/receiver pair. 10 or 20 db of process gain can't overcome that.

Need some hard drive expert advice.

I am running APRS packet 24 hours/day. Would like to save power and ware on the hard drive when it is not needed most of the time. Questen is: Can a 3PST switch be installed in the power line to the drive and turn it off while the computer continues to run APRS? I don't know if a rapid transient power on/off would harm the drive.

Most hard drives have about 200,000 hours before they are expected to fail.. Some have 250,000 hours. That is well over 20 years. I would assume you will get rid of the computer before then. I would think what your worrying about is not worth worrying about.

Yeah, multipath resistance improves with greater spreading widths. These
need to be measured in terms of percentage of the center frequency. If the
spreading doesn't represent a significant fraction of a wavelength, not much
multipath resistance is gained. This is the same as with the spacing of space
diversity antennas in conventional narrowband systems. If the antennas aren't
separated by a significant fraction of a wavelength, little space diversity is
gained. Of course we're using frequency diversity here, but the same principle
applies.

>Is part 15 devices direct sequence SS ?

Some are, some use frequency hopping (slow or fast). Fast hoppers have
characteristics in regard to multipath which are similar to the direct sequence
units. Slow hoppers have much less multipath resistance.

>I was mentionning the ability of receiving the digital signal of every

>
>Would amateur radio take benefit of this multiple access on the same
>band, probably yes.

Now here is another problem for amateur radio. Cellular has a common receive site, the cell site, at which signal strengths are determined and from which they are controlled. So it is relatively easy to maintain a consistent balance of received signal strengths (and reciprocally, transmit strengths to the distant receivers). But in an amateur radio context, things are very different. Transmitters and receivers are geographically dispersed. The free space loss between any given receiver and any given transmitter is likely to be very different from the free space loss to another receiver in the area. So there's no way to level the signals from all transmitters in an area at any given receiver.

This near/far issue isn't subject to automatic control strategies because it depends on geographic positioning factors which are outside the scope of any leveling algorithm. This near/far issue is going to mandate some sort of geographic coordination for SS systems, just as is needed for narrowband systems.

This is the flaw of the automatic power control requirement in the proposed SS rules. The intended receiver can command the far transmitter to reduce power to where the Eb/No of the intended receiver is 23 db, but it can't cause the signal strength in another receiver located a lower path loss away from the transmitter to be similarly low. We aren't operating cellular style, so cellular leveling strategies don't work.

Because it is a bit rate scrambler, it self-synchronizes as soon as the
shift register fills with bits at the start of reception. It retains sync until
the end of reception unless a bit error occurs. A single bit error cascades
to multiple bit errors in the descrambler due to the taps. This doesn't
matter for packet since even a single error trashes the entire packet
by failing CRC. It does make a FEC breathe a bit harder. Resync is
gained when the bit in error clears the shift register (max of 17 bit
times).

Because they also happen to be loads of fun, never mind the fact that alot of those big engines put out "safer" exhaust than the cracker box engines found in smaller European and even some American cars of non-American decent. Sure, a Geo Metro puts out less exhaust than a V10 Viper, but the exhaust out of the Viper is more than likely ALOT safer to breathe directly. This fact is commonly ignored by the "environmental" division of American politics. If they only knew what technology does, and how it works, and what it is capable of.

I guess that is too much to ask for,

David

As I said, if the road is flat, it will go up. Getting stuck on a rock
implies a road not for a car. My point was, power isn't a problem with
American luxo liners.

Indeed, if you are operating indoors, you need quite a lot of
spreading. It is interesting to throw in some numbers at this point.

Assuming equal amplitude between the direct and reflected signals,
they will completely cancel if the path difference is 180 degrees (or
any odd multiple of 180 degrees). However, shifting the other path by
30 degrees from the null, the received signal is about 10-20 dB below
the direct signal and increasing the phase shift to 90 degrees, the
combined signal will be at the same level as the direct signal alone.
Assuming for simplicity that the required path difference must be at
least 0.1 wavelength (36 degree phase shift), i.e. we can tolerate
10-15 dB signal fades.

If the path length is only 100 wavelengths at the problematic
frequency with a deep null. Shifting the frequency so that the path
length becomes 100.1 wavelengths, the signal is about 15 dB down from
the direct signal only. In a typical wireless LAN operating at 2.4
GHz, the wavelength is 12 cm, thus 100 wavelengths is 12 m and the
required frequency shift (1/1000) at 2.4 GHz is 2.4 MHz, so indeed,
you need quite large shifts for operating indoors.

However, looking at outdoor use on 70 cm, the situation is quite
interesting. Assuming a typical path of 7 km, that would be 10000
wavelengths and the required path length difference of 0.1 wavelengths
(more than 15 dB power margin required), the required frequency shift
is only 10 ppm or 4 kHz. At larger distances, the required shift is
even less, although you can not afford 15 dB power margins at those
distances. If 90 phase shift is required (received amplitude the same
as the direct signal only) the path length difference must be 0.25
wavelengths. At 70 km, the path is 100000 wavelengths long and the
required shift would be only 1 kHz. However, the situation gets

complicated, when the stations are close to each other, at 70 m distance (which would be the absolute minimum for a tower mounted repeater) and requiring 0.1 wavelength path length difference, the spread would have to be 400 kHz. However, at these distances, the power margin is usually much greater and less phase shift (say 10 degrees corresponding to 0.03 wavelengths) would be required, thus reducing the need for a large frequency shift.

At 1.3 GHz and at usable data rates (say 30-60 kbit/s) even a 10:1 spreading should help a lot.

These calculations are greatly simplified, while in the real situation the situation is much more complex with multiple reflections with uneven amplitudes. Normally, you do not have a "direct" signal, only several signals propagating using different multiple reflections, which can cause problems, if the path difference is large compared to the symbol length (at 1 MBaud, the symbol is 300 m long).

> This is the same as with the spacing of space
>diversity antennas in conventional narrowband systems. If the antennas aren't
>separated by a significant fraction of a wavelength, little space diversity is
>gained. Of course we're using frequency diversity here, but the same principle
>applies.

And a narrow band mobile system would be space/time diversity ? :-)

It is very interesting to look at the Rayleigh fade (e.g. mobile flutter) curve. When the average amplitude is close to the noise level, the signal may be good for, say, 90 % of the time, while the signal drops to noise for 10 % of the time. If we want to reduce the drop out time to 1 %, a 10 dB larger average margin is required. To get the drop out time to 0.1 %, a further 10 dB of margin is required. Thus, to reduce the drop out time to one tenth of a previous value a tenfold increase in transmitter power is required. In a multipath situation, you can not guarantee 100 % good times (which some simple digital systems require) with realistic power levels.

A spread spectrum system (at least a frequency hopper) solves the problem by distributing the drop out times evenly into each transmitted data bit (or symbol if multilevel coding is used). OTOH, the narrow band mobile situation, there are several dropouts every second and if digital coding is to be used, the message must be interleaved, so that the forward error correction can recreate the message from fragments around the dropouts. In both cases is the good time/drop out time ratio the same depending only on the average signal marginal.

I haven't read the wording of this proposal, but 23 dB should give a quite usable good time/drop out time ratio. While automatic power control makes sense for point to point operation, how is the 'intended receiver' in a broadcast style operation (such as repeaters and nodes) defined. Isn't the 'intended receiver' all stations within technical reach of the station ? In a Carrier Sense Multiple Access protocol aren't all stations intended receivers, since they must know when it is safe to transmit ?

This may be a dup in some newsgroups, and i applogize.

I have an Alinco 599t, and a KAM+.

Receiving is no problem

Transmitting from cpu to tnc, no problem, the tx lights up on the tnc, but the radio doesn't key up.

I have tried to reset the tnc via pulling the battery. I need to know if anyone has the pinout for the alinco. The cord I have is a premade cord, and the dealer said it was for alinco.

Can anyone help.

Thanks, and again sorry for the duplicate in some news groups

I have tried running Windows95 with the usual packet drivers that you would use with JNOS and Windows3.11 with no success. The problem seems to be a lack of support for the software interrupt structure needed for the DOS-like application to talk with the hardware. The best work-around to the problem is to stuff an Ethernet card in the Windows95 machine and network it to the machine running your JNOS application (as the ham radio router). I am successfully using this configuration to tie in my Windows95 machine, an older 396-33 running Windows3.11/JNOS and my wife's machine (KC7WOI) downstairs. All machines are connected via 10Base2 and share the same modem on my Window95 machine running a proxy server (www.StartechComp.com). Ethernet cards can be found for less than $30.00 each.

The older 386-33 running JNOS has two radio ports and a link to the real Internet. You can get more information about this gateway by surfing "http://wetnet.wa.com".

I would suggest leaving the power alone, as the mean time between failure (MTBF) will not be significantly reduced by cycling power. Most hard drive failures that I have had in the past have been in the disk not spinning up during a cold start. Usually an abrupt bump starts the drive, but this usually means the lubrication is failing on the drive and it is near the end of it's life. Most drives reach obsolencence after five years, which is about the MTBF for the units, so your savings will be small.

I've been running the same 80 MByte HD for the last 8 years 24 hours a day with no major failures on my BBS and TCP/IP station. It is now starting to show signs of cold-startup stiction.

> connectivity we've got.

High site is one solution, and placing low sites across the ground isanother. What we should want, as Ham's, is for placing low sites
across the ground, to be cheaper than one large site.

Steps up to the podium.

My fellow Americans... Let me first state, the enemy is mostly in our minds. The enemy is big government. The enemy is big Organizations that foster big government. Government regulation is like a cancer.

The band plan was an invention of necessity. We cannot keep going down that road. The band plan was a low-tech sharing tool.

Once you slice up the band for this group and that group, you finally come to the day that you cannot slice it further. Like a big pie, and a crowd of hungry people, you can't just keep making smaller slices. Some have to be fed with big slices, others must be allowed to die.

You can't take a city of 30,000 people and use that argument for a city of several million. Places like New York City, and Los Angeles are what will drive the spectrum technology. People need to communicate, and sharing narrow frequencies has been a good solution the last 20 years, but demand is straining that solution. It cannot continue as THE solution.

We cannot keep deploying technology from the past. The public expects Ham's to be innovative. They offer a huge spectrum which is mostly squandered. Remember, the spectrum is not ours by right, it is ours because it was excess. The people won't stand for a part of society being fat with spectrum, while the rest suffer commercially.

They will not settle for a small slice. They will take a big slice, and Hams will just die.

Think of the future. What are we going to do 10 years from now? What technology can we develop and deploy NOW to get us to that future point. Will your grandchildren still buy an FM radio to talk on a repeater? Will they still use SSB to wedge themselves into the HF bands?

I think everyone can agree, that we want Ham radio to exist and be a source of fun, as well as function. We have wide chunks of spectrum that exist merely to echo morse beacons, where in the past, real humans used to communicate. The repeaters are dying off, the digital modes are dying off, and as they do, we need to block off this spectrum for more advanced technology. Within the next 5 years, if Hams do not retire the narrow segment band plan themselves, they will cease to exist from external pressure. If on the other hand we use the whole band as a segment, and share the bandwidth, then we will again offer something that we can be proud of, and the public will respect.

Hi,

I am posting this for a friend,

Glen, KC4KMY is on temporay assignment in St. Thomas USVI and has set up a portable PACTOR I/II mailbox consisting of an ICOM 706, an SCS PTC-II TNC, an SGC auto tuner and a short whip antenna. I can connect to the station from Maryland and he is interested in connects from as many folks as possible while he is down there. The station is on 14071.00 KHz -- USB Low Tones (1200/1400) -- direct mailbox is currently off so access the mailbox using // commands (i.e. //s kc4kmy to send him a message or //help for command list). In this mode the system does not automaticly switch between Tx and Rx so you will have to do a changeover command manually. Glen would like to get an idea of his coverage using this portable setup so please give it a try and drop him a message with your QTH...

Thanks and 73,

Art -- AA3GU

We might *want* that, but the reality is just the reverse. We can obtain and
equip a few high sites, but we simply cannot obtain and equip hundreds of
low relay sites to cover the same area. We aren't a common carrier with
billions of dollars, and the power of eminent domain.

SS is a good technology, and we may find a number of applications for
it in bands with high usage, if the regulations ever allow us to use it on
such bands. But a cellular approach is simply outside the realm of
financial possibility for an amateur network. We are too thin on the
ground to support it, even in the top 10 metropolitan areas (of which
Atlanta is one). We'll need to continue to coordinate high site relay
indefinitely because that is the only feasible way to deal with our
very sparse network topologies.

If you have the information available, take a look at
the specs for PSA's HDI engine. This is going to replace
the already excellent XUD fitted in Citro&#65533;ns. An already
excellent fuel consumption reduced by 20%. CO2 reduced
by 20%, HCs by 50% and particulates by 40%. Ozone
forming potential down 50% and produces no smoke.
The only remaining problem is NOx which is dealt with
by a cat-converter.

Good diesel fuel may well be the same price as unleaded
petrol (here) but the fuel consumption and environmental
advantages of diesels will mean that as the government
increases the tax on fuel by (20p/litre/year was it?),
the public will be forced to look more closely at this
fuel. Un-facts pushed by our ghastly media have managed
to generate an anti-diesel culture here which isn't to
be found anywhere else in the rest of Europe.

Right! I always read the label. Latest best lager was
Tiger from Singapore. Imported. Best continental lagers
are Kronenburg 1664, Stella, Staropramen (or any genuine
Czech lager), Zipfer, Stiegl. Kronenbourg and Stella you
have to be very careful about as they are brewed in England
without hops and are as tastless as English bitter.

Your analogy doesn't hold alot of water (pardon the pun). You already have a much greater chance of falling down and breaking your neck while pouring yourself a cold one than dying from exposure to nuclear radiation from a well designed plant. Sure, there is always some way for all the wrong blocks to align themselves in anything, and thats my point, and why I used the term "almost 100%". Just as there are aliens controlling our minds, the plastic eraser on my desk could suffer spontaneous quantum deconstruction, wiping out 13 or 14 city blocks, or even more unlikely, American amateurs will have a high speed nationwide packet switched radio network :-) (couldn't resist). You shouldn't always place your bets on the "sure win" or you'll never progress. There is chance involved in anything.

Hi Chris,
The manual gives you all this info on page 62.
You need the following
Pin 3 is the receive audio and goes to the audio input of the TNC
Pin 9 is the PTT and connects to the PTT of the TNC
Pin 11 is the audio input or Transmit audio and connects to the audio output
of
the TNC.
The supplied 13 pin connector opens like most any din plug. Just pry up on
the back end of the little horse shoe shape on the side of the connector and
pull the metal shield part of the plug out. The rest will come out with the
shield.

Hope this helps.

And I quote from the GEET page:

"... some of the mixtures were done with mixtures with as much as 80%
water."

I wonder if anyone will ever realize that as much energy as is derived
from burning hydrogen and oxygen, it takes even more to separate it.
There never will be any magical way to do it with minute amounts of
power, or you would be tripping up physics as we know it.

In dream land, of course, the following would also be possible:

My next Camaro will get 1000 miles/gallon of water and do 60 in less one
second, and weigh over 6000 pounds to achieve that good ride all the
luxo liner buyers are looking for in a car. (and the US Amatuers will
have a high speed packet switched infrastructure nationwide :-)).

On the other hand, I do think hydrogen will be our future fuel
technology (after we have pumped every last existing drop of petroleum
product from our crust), but it will be separated at solar stations that
convert light to electricity and use it to desalinize and then decompose
sea water into H2 and O2. Those stations may even end up being powered,
not from solar cells on the ground, but satellites beaming down
microwave energy from collectors in space. It would be alot cheaper
than ground based solar energy collection, given that we one day achieve
cheap spaceflight.

Also, one thing the green planet enthusiasts don't consider, those
electrical cars that they so gladly will buy up when they become
available, will have synthetic lubricants in their gear boxes, motors,
and air conditioning systems.

On (Sat 28 Feb 1998) I had a QSO with UK Radio amateurs who
were happily sending packets to USA, to telnet to a group who included
a USA amateur who was in the same group - but using a regular ISP
internet connection!

It seems the guys who set up this "net" issue their own internet ID
number sets (the famous sets of digits separated by fullstops), except
the first number is 44 (instead of a 3-digit one). The "44" signifies
a amateur packet connection, and such an ID should not pass through
a server here as if it were a regular internet packet.

I tried telnet into this packet server, but I must have done it wrong.
My ISP accepted the address, but failed to connect. I freely admit
there is just so much I don't understand about how this is done. I
think that launching a packet to a US station by amateur radio
is unlikely to be illegal here, just because some other users of that
station happen to send their stuff via an internet route..

While this subject is interesting enough to roll up unusual numbers
of postings, I have got to admit that it is probably in the wrong group.
I'm not fussy or pedantic. Say it here if you like - but you may
expect some flak eventually from the net "hobby bobbies".

What kind of logic is that?

They are two different nouns:

Auto radio
Weather radio

One has nothing to do with the other!

Why not form the question in a way that the english speaking population can understand:

"Why can't an auto radio pick up emergency weather alarms from NOAA?"

With that, anyone familiar with radios and capitalist marketing 101 can answer the question.

Your question on the other hand, is akin to:

"If birds are so good, how come humans can't fly?

It's just a poor construct.

My dad's Citroen BX (Ford Escort class) 1.7 litre diesel was
quite respectable at 0-60mph in 10-11 seconds, admittedly it
had a turbo compressor, but most diesels have nowadays.

Looking for a simple,cheap,easy to build transmitter in the 11 meter band
that will transmit a dead carrier on dc power.

Hi,

It's been a long (long!) time since I've configured BPQ to work with
the multiport AEA TNC's, so I can't be extremely specific in the
instructions involved. I can point you at what I seem to recall are
the commands you need to set to get the TNC into multi-drop KISS mode,
which is what you need to do.

First you need to set the KISSADDR command to contain the two KISS
addresses you want to use for each port of the TNC. The command
should be something like KISSA 0/1 to set port 1 to kiss address 0 and
port 2 to kiss address 1.

At this point you need to put the TNC into extended KISS mode - not
just the usuall KISS ON command, but probably something like KISS 7.
Compare the options in the BPQ code for polling, checksum, etc, with
the AEA KISS command options for the same, and create a matching
condition. I know that the AEA KISS mode supports polling or
non-polled mode, but I don't remember about other options. It's been
abour 5 years since I tested these modes as part of my job at AEA, so
I just don't remember all the details, and don't have all the docs at
hand.

I hope that gets you started in the right direction!

I can't think of any reason why reporting weather conditions would be against the rules. Packet stations operate unattended all the time, automatically relaying messages and so forth. You might be in a grey area with that motion sensor thing though, it could be considered a commercial application if you were doing it to avoid fees from an alarm company, or accepting remuneration yourself for doing it. THEN there's the whole issue of having an unlicenced person (or, ummm... whatever) activating an amateur transmitter by tripping the sensor - kind of like the whole, smelly, reverse-autopatch on repeaters issue. I've seen articles on weather monitoring with packet, so it has definately been done before.

I suggest that your best bet would be to contact Industry Canada and ask a radio inspector. I have had spoken to them in the past in order to clarify issues related to experiments I wanted to perform. I have always found them to be courteous and helpful whenever they were responding to my queries. Plus, it never hurts to have a paper trail if some other Ham decidedes to cause a stink. I've found that it's far more likely you'll get trouble from a lethargic and jealous Ham annoyed that your doing something unconventional, rather than from the Feds. The hardest part will be getting ahold of someone at I.C. to talk to in this age of cutbacks.

Good Luck with it! - Alan, VE3NNM

Because they use different frequency bands, and car radio manufacturers
aren't interested in pricing themselves out of a competitive, price-conscious
market.

Delco made a version of the popular 2000 series radio that
did include NOAA weather. I'm not sure what model of GM car it was an
option in or the exact model numbers. Check your local junkyard.

I too was a bit bewildered by the original question. If we're talking about
NOAA weather voice broadcasts in the 162.400 MHz region then the topic is
not appropriate for a digital newsgroup. If we're talking about digitally
encoded weather alerts then maybe it almost is.

1211. Remote telemetry

Please forgive me if this is a dumb question, I'm quite new at the digital side of the hobby.

Is it legitimate under Canadian amateur radio rules to set up an unattended packet station to transmit small amounts of data eg hourly temperature, or perhaps the infrequent operation of a motion sensor, from a remote location to my base station? If it is, can you point me to where I could learn more about how this is done?

Source record: 25174

I take it that you have read all the docs that came with BPQ408A.zip?
This would be a good start. This special extended KISS mode, sends a
"address" out as a kissframe to cause the KISS tnc to "respond" with
anything, or if there is data, the tnc then will take the following
kiss data and transmit it. A slick way to only have a small number of
serial ports.. I got this info from reading the docs from that
BPQ408a.zip files.

Some of them can and all of them should.

The radio that came in my brother's BMW did and it was really
nice to have.

You might want to check your local car radio store.
They may have some models that have it.

I hope this helps,

Hi,

After seeing a mention of the wartime German direct printing telegraphy system "Hellschreiber" ("Clear writer"?) in a magazine over here I've started playing around with the LA0BX Hellschreiber simulator program using a "Hamcomm" type interface. I've had some QSOs on 80m where there is a net in Europe on Sundays but over the last couple of days I've heard some activity on 20m from VK2.

I'd be interested to hear from anyone, anywhere, using the mode and particularly I am interested in alternative hardware and software, as my setup is fine for a clear channel but a bit limited for the "real world" like the lower end of 20 metres!

Hello all

!!!!!!!!!!!! PLEASE NOTE THAT THE N.A.R.S.A. Rally IS ON !!!!!!!!!!!!!!!

here is the text of an email sent to me by Carl G6MEI (the secretary of NARSA)

you can find some info about the rally on my web site at

HTTP://www.g1gyc.demon.co.uk/narsa/narsa.htm

<<<<<<< SNIP <<<<<
Hi Martin.
Bits of late news.
We are ON for setting up the main room on Saturday Afternoon as the event has been moved into the ballroom. Don't know about the motel lounge for you though.
I am getting msges that people are still saying the event has been cancelled and there is a web site (which I have not got onto yet) saying this. S search for Norbreck on yahoo threw up your page + some ehbition firm details of Norbreck.
We are mentioned on the RSGB rallies calendar.
Could you please amend the home pages to say the event is definitely on contrary to false reporting and mention the overflow car park at Little Bispham and free shuttle bus.
It will be going out on the GB2RS news as well.
Presume the home pages are still intact. I could not get on today from work.
See you a week Sat/Sun.
cheers
G6MEI

Please cross post this item to as many places as possible. OLT is actively seeking to market this course. If you know of a list or news group that may have an interest in promoting online educational activities, please send them a copy of this message.

Thank you.

Terrence R. Redding, Ph.D.
President/CEO
OnLine Training, Inc.

http://www.olt.net

OnLine Training, Inc. is pleased to announce the release of its course -

Writing skills -

Writing Skills - This course is primarily designed for individuals pursuing a GED but may also serve students interested in a general course in English. The course is instructor led (guided learning), taught in a virtual classroom. Depending on the needs of the student and course load, the instructor may provide one-on-one instruction or organize the students into groups. Students will have separate E-mail accounts and discussion groups in the course within which to dialogue with the instructor and other students. The course includes the elements of Standard English, sentence structure, and the parts of speech. Compositions of approximately 200 words are also required.

This course will introduce you to the skills needed for the writing portion of the GED. You will have the opportunity to learn the difference between sentence fragments and complete sentences. You will also learn the major parts of speech, including nouns, pronouns, verbs, adjectives and adverbs, subject and predicate, basic spelling rules, and

punctuation. You will learn paragraph structure and the four types of writing; narrative, descriptive, informative, and persuasive. Upon satisfactory completion of this portion of the course, you should be able to successfully pass the post-test for the course and perform acceptably in the Writing Skills portion of the GED test.

This course takes between 15 and 40 hours of student effort to

complete.
Cost: $75 US.

Courses in mathematics, literature and fine arts, science, and social studies are currently under development and will made available as soon as they are finished.

Group rates and program discounts are available. The complete

five part
series may be purchased as a complete program for $250. Individual courses are
$75. City, county, state, and federal agencies may negotiate separate rates.

OnLine Training is actively seeking certified public school teachers who have an
interest in teaching educational courses online. OnLine Training is designing its
revenue sharing structure to permit quarter time instructors to

earn up to $10,000
per year, and full time instructors to earn up to $40,000.

OnLine Training is also actively seeking individuals to prepare continuing
professional education course for medical management, real estate, and
insurance industries.

For more information please contact OnLine Training, Inc. at (561) 357-0841,
http://www.oltraining.com or mailto:admin@oltraining.com.

There was once an article in Ham Radio magazine about the "Hellschreiber"
system. It was 17 or more years ago (it was after it went to the larger
format, in 1976). It detailed the system, and if I recall correctly,
showed how to build your own printer. My magazines are not in any order,
so I don't have an easy way to look up the article.

la>LAurence

We went paddling in the sea downstream from Windscale with 2 little dogs, a few years ago. They seem OK (The dogs. And the feet. The "Daily Mail" would be far more worried about what the poor little doggies left in the water. AND the feet.)

We also went swimming off Aldeburgh, not 2 miles from Sizewell, most mornings. Then one evening we walked back from dinner after dark and saw the sea glowing green where the waves were breaking. Very pretty but we paused for thought. After realising the true explanation we resumed bathing in it.

Thanks Michael,

I have a detailed article on the wartime system that was in a 1981
edition of the RSGB's "Radio Communication" magazine but I'm looking for
more modern applications. I know that HS reception is available on the
more exotic decoding packages like Hoka but I think that someone out
there is using DSP packages for TX and RX.

Cheers,

The only thing commercially available is Spread Spectrum radios. These don't use FSK (and only microwave could swing that far, but there are no commercially available microwave FSK devices at consumer prices).

You should be able to find a 1 Mbps or 2 Mbps device, but the range is not going to be great. Most of these are 1 Watt radios (or less).

Go to:

http://www.tapr.org

and you will find a link to Spread Spectrum and then a source for radios.

I presume you want more than just a radio. You most likely want a
digital interface and some networking support too don't you? The 904
MHz radios I designed and use on the RF WAN here in northern California
will run that fast. However the PI2 cards we use to interface them to
JNOS or (soon) Linux do internal data clock recovery at board_clock/32
which is 230.4 kbps on a stock board. I suspect with 20 MHz parts and
clock that you could get 625 kbps. Perhaps you could push them further.
You could also utilize some kind of external clock recovery and then I
am pretty certain that stock boards would work fine. I've had them do
similar on the bench.

Quite a lot I should think: on the roads, on the seas
and rivers, not to mention in earthquake and flood.

I asked the same question several months ago and got mostly silence.
One guy did say he thought that pactor support was in the latest FBB
beta code.

So, for the moment I've blown Linux off my shack PC and it's running
DOS so I can run RITTY. Bah.

Hope someone can tell us otherwise!

It very well may be classified, but it's common knowledge in Idaho
where it happened (where I learned of it).

My details may be off somewhat, but it goes like this:

It was an experimental 3MW reactor operated by the U.S. Army. During
the Christmas shutdown a crew of 3 techs (minimal nuclear training)
were to do maintenance on the rod drive motors. The rest is
speculation as the crew was killed and no one knows for sure, but it
seems that after servicing the motors, a tech was swinging the first
one back into place on a chain fall and decided that it would be much
easier to pull the control rod up to the motor to attach it rather
than bolt the motor in place and then attach it to the rod. This
reactor was designed such that a single control rod could take it from
shutdown to supercritical (Not surprising since the design was for a
portable field reactor for Army use). The tech apparently got the rod
up about a meter when the reactor went supercritical and the cooling
water surrounding the core flashed instantly to steam thereby forcing
the other control rods from the core from the pressure and
subsequently cooking the crew. The fact that the core was not
pressurized and the water vacated immediately resulted in more of a
squib reaction than a full nuclear blast. It was a slow fission
reactor and with no water to moderate the neutrons, the reactor
basically shut itself down. The core was damaged beyond repair and the
whole plant had to be decontaminated and scrapped.

Kind of funny how Timewave's "presence" disappeared, huh?

Roger,
The DSP-232 is plagued with many glitches that prevent successful and pleasant operation. I was involved in AEA's beta testing when they were trying to correct the problems, so I don't have the original firmware installed (I think my version is worse!), but the DSP-232 does not support all of the modes that the advertisements claim(ed). Also, I seem to remember a fairly significant problem that caused the packet mailbox not to work. Timewave had assured me that they were working on developing a new firmware release, but the date they had given me has passed and I'm having no luck getting ANY answers from them now. To be fair, they inherited the problem from AEA, but on the other hand I feel that when they bought the business they should have taken responsibility for the customer problems, not just the profitable portions of the business. Unless, you're getting a deal, I'd recommend another manufacturer. Every now and then I see an ad for the DSP-232 from a couple of years ago and it gives me quite a chuckle. And then it doesn't.

Well, anywhere major construction occurs there are the occasional deaths associated with it. Years ago I saw a vintage newsreel describing construction of the Depression-era Hoover Dam in the western USA, and as I recall the primitive footage showed a "T-model" truck falling over the edge of the gigantic dam in progress. Seems like over a dozen workers were killed in that project, and that doesn't count the "gangster victims" that were mixed in with the concrete. Construction deaths also do not include the thousands of deaths over the years from mining coal. I grew up amongst Uranium mines and mills and tailings piles and I recall 2 or 3 deaths associated with accidents from heavy equipment operation etc., cave-ins and such, but I recall no old-timers dying from coughing up their lungs slowly, as they do in the areas surrounding the coal mines of the USA.
Even Chernobyl, that hiss-and-byword of the nuclear horror group, fails to approach the casualties incurred from more conventional methods of generating power. (Generalization gleaned from Reader's Digest article on Chernobyl from some unknown months ago)
Is any of this on-topic for this group? Oh Well
Jim W5AOX

Actually, it's 28.0-28.3 MHz, 1200 baud, with a frequency shift not exceeding 1 kHz, [see 97.305(c), 97.307(f)(4)], with a digital code per 97.309. Only phone and image are permitted above 29 MHz.

For those interested in finding FCC amateur regulations on the web, go to http://www.access.gpo.gov/nara/cfr/index.html and search for part97. It is available in both text and Adobe .pdf format.

Folks,

This is the last place to request for this information. I'm trying to find some datasheets (at least a pinout) of the following ic's on the full length 900MHz Wavelan Cards:

NCR Daedalus (008-0127211)
NCR Holi (008-0126998)

Any other technical information (ie: a service manual) would also help.

If anyone could be of assistance It would be much appreciated. I have scoured the net looking for tech. info on these cards. The Wavelan site is useless (except for the drivers and doc's). NCR seems to have sold off thier semiconductor wing. So my hope lies in a last attempt that some wavelan tech might read my message and be willing to help.

Thank you for your time.

Brian

All of the signals you need for your KAM are on the 706's rear panel ACC socket. I used Icom's OPC-599 cable, which splits ACC into an 8-pin DIN connector (ACC1) and a 7-pin DIN connector (ACC2) that matches whats provided by other ICOM radios and mates with connectors available at Radio Shack. As I recall, Icom and Kantronics each give you a cable with their molded connector on one end, and pigtails on the other -- so you have a little bit of construction one way or the other.

1271. Windows 3.1 simple packet program needed...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-08 00:00:00 UTC
From: Dave Hockaday <kf4dbx@ipass.net>
Message-ID: <3502E40A.27C@ipass.net>
Source record: 25041

Hi,
I'm looking for a simple windows packet terminal program. It needs to be able to do screen capture, ascii transfers, and support com3-4 with a selectable interrupt. I want to run it on an IBM PS/2 model 80 MCA with the
dual async adapters for com3 and up. Since the extra com's (3 and 4) aren't
defined in BIOS, a dos program can't find them. I'm running WIn 3.1 on the
system, and com 1 and 2 are stuck with dos applications that can't be moved
to a different com port.

I've tried the packetpet, etc...but those are way too complex for what I want to do. I can use the window's terminal program, but it seems to be limited in buffer size and long packet messages/ascii files can't be transferred.

Any ideas??
Thanks
Dave Hockaday WB4IUY

Well when I was work on developing software for the DSP232
I found several problems here is a list (of those that I remember).

1. Possibility of locking up the serial interface and
generating a fatal error. It appears that the
hardware hanshaking was not work or that the
TNC has too little input buffer. This is a MAJOR
problem in the TNC. If you want to test it, try
very quickly typing DISP Z at the CMD prompt several
times in a row, The odds are you will get the error.
This same error also exists in Host mode.

2. Many of the Host commands do not work as they should
The two that come to mind are ZFREE and ZSTATUS. The
status commands always reports that the data buffer
is empty.

3. Minor point, but the product code for the 232 is the
same as the 1232 (remember that one).

4. There are more, especially in the operational side, problems
with AMTOR and a few other, but I dont have my notes
sitting here.

I gave up on the DSP232 and mine is sitting high on a shelf
in the awaiting some time of firmware update. The problem
is I have the feeling that it may also require a few hardware
changes to make the box right. It is a shame as I also own
a PK232 and PK900 and both of these are excellent units.

hello,

i have a alinco dr600 and i don't need to extend the tx/rx mod
because it was already extended when i bought it. :)

After I closed it all was well except it was in the U.S. mod.
(144-148,440-450)
What I need to know is how to put it back in to the european mod
(144-146,430-440)

please help me

thanks in advance

Mario

> "Linux is to Windows
> ... as Betamax is to VHS"

U got it!!!
Linux _is_ to Windows what Betamax was to VHS!

Why do you think the majority of images you see on your televsion are
gathered using
GASP .....betacam! Beta was a far superior product to VHS and always
will be.
Marketing and release of the licensing of the format was the secret to
VHS success, not
quality.Marketing is also the reason for success of Windows...._nobody_
would accept
the horseshit brought to you by Microsoft if they were _really_ thinking
and not mindlessly
accepting marketing vs real world scenarios.

Windows is to crashing as VHS is to being "un-broadcastable". They are
both a given.

They say you can't polish a turd. Never tried. But Bill G. is as close
as close can get.

1276. KanPak for Commodore

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-08 00:00:00 UTC
From: Joseph Fenn <jfenn@lava.net>
Message-ID: <Pine.BSI.3.96.980308112121.16310D-100000@malasada.lava.net>
Source record: 25046

I got the original KANPAK software for Commodore64 and Commodore128
on a disk with a bunch of other CBM stuff. I am wondering if this
C128 version of the software will drive any of the KPC or Kantronics
TNC's? I like the 128 version and will use that if I can find a
TNC that it will drive. I assume that from the book all the TNC's
(if any) that are useable will use the RS232C port (not the cassette
port). I sent mail toe Kantronics home page but no response
forthcoming yet. They apparently had a TNC called the "UTU" or
something like that (Universal Tapr Unit) I guess it what it stands
for. Any help would be appreciated.

A new BETA version (1.0b6) of RDCP/Mac has been posted at:

<http://www.winternet.com/~nedbalek/software.html>

This is a FAT version for both 68k and the PowerMacs. Documentation in
HTML format is included in the download. The documentation requires a
WWW browser capable of frames.

This version adds support for the "QRZ! CDROM Call Sign Data Base".
<http://www.qrz.com/>

RDCP/Mac is a specialized communications software package that interfaces
your Macintosh with Kantronics <http://www.kantronics.com> TNCs.

For anonymous FTP downloads:

<ftp://ftp.winternet.com/users/nedbalek/outgoing/RDCPMac.sit.hqx>

For users of "NET/Mac", a version of "RDCP+/Mac" is also available.
RDCP+/Mac adds selected TCP/IP features to the regular version of
RDCP/Mac. Read the information page from the http link above for
limitations, equipment and software requirements.

jd>>stations started.
jd>> (Well, in Scotland, anyway.)
jd>Well, anywhere major construction occurs there are the occasional
jd>deaths associated with it. Years ago I saw a vintage newsreel
jd>describing construction of the Depression-era Hoover Dam in the
jd>western USA, and as I recall the primitive footage showed a
jd>"T-model" truck falling over the edge of the gigantic dam in
jd>progress. Seems like over a dozen workers were killed in that
jd>project, and that doesn't count the "gangster victims" that were
jd>mixed in with the concrete. Construction deaths also do not
jd>include the thousands of deaths over the years from mining coal. I
jd>grew up amongst Uranium mines and mills and tailings piles and I
jd>recall 2 or 3 deaths associated with accidents from heavy
jd>equipment operation etc., cave-ins and such, but I recall no
jd>old-timers dying from coughing up their lungs slowly, as they do in
jd>the areas surrounding the coal mines of the USA. Even Chernobyl,
jd>that hiss-and-byword of the nuclear horror group, fails to approach
jd>the casualties incurred from more conventional methods of
jd>generating power. (Generalization gleaned from Reader's Digest
jd>article on Chernobyl from some unknown months ago) Is any of this
jd>on-topic for this group? Oh Well Jim W5AOX

Yes, but the privately owned (since inception) hydro electric scheme (5
V DC at 100,000 amperes - visitors leave watches and pacemakers at
Reception please) at Fort William, Scotland (aluminium smelter), has its
own private graveyard. Or do I mean the other one at Kinlochleven?
Probably both. The photos are at Kinlochleven Visitor Centre. Those
photies of the dam being built give me vertigo.

John,

Thank you for taking the time to respond. You've almost impressed me. As you might imagine, I am anxious to hear the details of the trade-in program. When do you think the specifics will be announced? Also, I sincerely hope that the trade-in allowance will not be a 'token' allowance. There are many folks who paid top dollar for their DSP-232 and have not been able to use it (I fall into that category). I'm sorry to hear that beside the obvious firmware problems, the hardware platform is not sound (as stated by Timewave before). I appreciate your candidness and hope that the replacement product will be a big success.

As for the list of problems and workarounds, why not post it now?

Regards,

Glen Menendez KD4EQI

Hi Dave:

Have you tried WINTNC? I just installed it last weekend. It works well
even under Win. 95 and is supposed to work under Win 3.1. It's pretty
flexible with ports and interupts. It even works with my Baycom and
KPC-3.

You can download it from: http://www.tigertronics.com

Just look for their software download page and get the file
'wintnc11.exe"

David,
Perhaps you don't understand how the GEET works. It is not using electrolysis
to split the water and use it. You simply run it in the tank like gasoline.
Even if the mileage would go down, (it should actually increase) it would
still be acceptable as water is still essentially free.

As the Subject says, I am looking for any software programs for a DOS, Windows 95, and/or Windows NT system to work with my Yaesu FT-900/CAT and FIF-232C computer interface.

Thanks much in advance.

Yeah, so do I!! The 3105 was an absolute sweetheart of a chip, and
is darn near impossible to find now. I hate myself for not buying
a couple of dozen when they were being closed out at $2.95 each!
The last time I heard a price quote, they were selling for just
under 20 bucks each, and I'm sure even that source has dried up.

There is an alternate circuit for the Baycom/DIGICOM>64 packet
software that uses the tired, crappy old XR2211/2206 combo, however
they are very poor in performance and their settings drift and are
very unstable. The only thing more annoying than trying to work
with one of these modems is being the poor guy on the other end of
the connection!

I have found some listings of low-speed modem chips at the Motorola
and Phillips web-sites, but haven't experimented with them yet. Any
ideas out there in Cyber-land??

1293. FS: MFJ 1278 Multimode TNC

I have two MFJ1278s for sale, one has the accessory 2400 baud modem.
Both have the latest firmware ver 3.7, and a brand new MFJ Multicomm 3.2
software package. I have manuals and cables to go with it.

MFJ 1278 w/2400 modem $125
MFJ1278 $100
Multicom $40

How the heck???????????

NOT!!!!!!!!!

Lets get something straight .... water has NO POTENTIAL CHEMICAL ENERGY. Please note chemical. If it had potential chemical energy, rivers would explode on contact with a miserable cigarette some bridge crosser happened to toss out the window of car, or at least flare up. Its also guaranteed that steam in nuclear plants or coal installations would ignite in explosions as yet unrivaled. Sure there are things that react with water, buts it because the potential lies within the other chemical, not water! Water is about as stable as you can get for generically available chemicals. Many like to point to Chernobyl about how water will burn. But they miss the simple fact that the core was so hot, that enough energy was available to destructively breakdown water molecules. This in turn led to hydrogen and oxygen, which upon cooling to a few thousand degrees, ignited and burned. So it took alot more energy to break it down than it provided on recombination.

If you dilute gasoline with water, you have only increased the amount of the "mixture" necessary to move the car, cause water DOES NOT EVER BURN. Its nuclear potential is out of the question in a car motor, and largely out of question as of yet even in nuclear physics. Thats even if a modern fuel injected car would run at all with water, since water sticks together and doesn't dissolve well in gasoline, it will most likely be the only thing coming down an injector for several seconds, if one is lucky and fuel comes down at least two or more injectors of other cylinders, maybe the engine will run. You can increase moisture content in alcohol fuels or fuels with alcohol content, but it only reduces power, once again requiring either more fuel or that you live with less power.

I guess you view "Chain Reaction"'s energy source as a possible modern energy source. Get REAL! Where do you get this stuff???? I guess I'll never know.

I have built and sold hundreds of 2211/2206 based packet modems that are
actually quite stable IF one takes care to use dipped ceramic capacitors
for the receive 2211 circuit.
I still have several that have not been touched in years and will still
fire up and work with no "tweaking".
I have researched this phenomenon quite deeply and have never been able
to find a satisfactory technical explanation as to why dipped ceramics
work so well in these circuits while others, such as high-accuracy
polystyrene caps, do not. I stumbled onto the ceramics quite
accidentally as a result of using "junk-box" parts building several
units and finding some modems worked with great stability while others
drifted so fast it was difficult to even get them to decode packets at
all.
I never "upgraded" to the TCM3105 because, even as early as 3 or 4 years
ago, I could NOT find vendors to sell me any.

David,

I have to throw in my 2c, I mean 2penneth worth as I have a close
working colleague that has witnessed a GEET processor in operation.
May I make a suggestion. As you're in the country of origin of the GEET,
may I suggest you take your blinkers off, dial-up the GEET.com web-site,
get yourself along to the next open display/lecture in a town near you
and simply observe.
Let's just say I'm intending to order a new Z28 Camaro later in the year
when the retrofitted 350 V8's have been fully sorted and will be
bringing this car back to England via the GEET site in Utah.
A damn long way to drive for something that does'nt work especially as
I'm buying the car in DA.
Tell you what I'll do, to help you off with the blinkers' If after a
personal demonstration you're not totally convinced of the GEET's
ability to live up to the manufacturers claims, and yours, I'll
personally send you $1000.

Here's what it does (I've owned a turbo and know the tricks), it cools the air entering the engine, therefore the computer or human hand tuner can run a more aggressive timing profile, higher boost, and more fuel. But, as you say, its a fine mist, not GEET. Many RV's have such systems installed just to reduce detonation during hard climbs.

> thought I'd throw in.

Being also a person from the part of the country where the best thing on a Saturday night is a truck pull (I really do not enjoy professional sports at all, except NASCAR, NHRA) or a mudfest somewhere deep in the woods, I have quite a bit of knowledge of how tractors used in tractor pulls work. The deisel SuperTractor class, unlimited of course, injects water at the end of the track to cool the cylinders and pistons, or even with normal watercooling, the engine would just melt.

But none of these applications mentioned as of yet are equivalent to what GEETS claims, which is power from displacing fuel from a mixture and replacing it with water.

More GEET:

I read their page fully and all the so called "testimonials". It reads like a comic book. The stupid antics they pulled, etc. (yeah right) and in addition to that, none of the engines were tested under load. I can assure you they would have stalled it with the simple application of a clutch, in particular with regards to the 350CID Chevrolet motor and its accompanying Camaro body and transmission. How come no dyno test? Very few make these claims without dyno readings to back it up. If the observers had known anything at all about engines they would have requested exactly those specs. A modern computer controlled, sequentially fuel injected push valve engine can run without a noticeablely smelly exhaust after warm up. So what? Even funnier than all of that, was the complete lack of control systems for the fuel processor. I couldn't stand it any longer .....

The next funny thing is the control system for the GEET device. No electronics were mentioned, no connection to the throttle assembly, as described anyhow. That means one of two things, when the engine suddenly demands a large amount of power, it will lean out, stalling and perhaps detonating to the point of engine destruction, or two, the fuel processor will take minutes to adjust, and by that time the motor will have spewed tons of sorry old HC's out the exhaust.

On to something with content applicable to the group:

Anyone played with the Part 15 SS equipment available commercially? What kind of pricing are we talking here? I live in the city, and am a apartment dweller, which also applys equally as well to my fellow networkers, so foghorn desgins just aren't gonna work for us. Spread spect. will be the key until I move out to the country side. Prices, companies, experiences are welcomed.

Excuse me while I laugh till I cry about GEET's fuel processor,

Pearce

Hello,

I am trying to help a friend who is just getting into the digital modes. He has a Kenwood TM-255A and a PK232MBX. I have the code for the wiring to the data plug at the back of the TM-255A. And, I have some older (maybe not too outdated) info from AEA about the wiring from the 255A to the PK232.

Unfortunately, I don't have a list of what TNC wires match with the Kenwood.

If you have done this and can give me some help, I would surely appreciate it.

73,

George, K5AIE

Maybe you should take it as a signal that 1200 bps AFSK is getting
a little bit out-of-date now...

Greg,
Most of the portable packet I have seen have been done with the HP 100 / 200
series of palmtops.. I guess the big reason is that they run DOS. (A
stripped down version.. but it is DOS)
The Casios, Sharps, and Psions all do not have the ability to run DOS.
However, I have been told that some of these units have been used for packet
by using the Terminal program. (Now we are talking basic packet here)
but I guess it can be done.

There are at least two vendors in Germany that have TCM3105 on stock:

Giga-Tech
Friedrichstr. 8a
D-68536 Heddesheim
Germany
Tel.: +49-6203-44142

and

Landolt - Computer
Robert-Bosch-Strasse 14
D-63477 Maintal
Germany
Tel.: +49 6181 45293
http://www.landolt-computer.com/info/afuinfo/tnc2c.htm

They also sell parts for the RMNC system (needed for RMNC/FlexNet, the
hardware platform used in Germany for PR digipeaters).

Has anybody ever played with this in a ham context? Other
than the obvious applications, like IDing WBFM microwave
stations, it occurs to me that the available decoder
chips (e.g. TDA7330, a Costas Loop PSK demodulator) could
be the basis for some very simple, very cheap data radios.
They just wouldn't be very fast...

>snip<

That's correct. It is also true that piston engined aircraft have used water injectors for years to increase power and range. The water is not used as a fuel, of course. It's certainly not an octane booster. Still, for whatever reason, a fine mist of water enhances the action of the fuel/air mix in large piston engines. (I've never heard of it being used on small engines.)

A few years ago, my brother added a water injector system to his hotrod (65 Dodge van) , and noted a slight difference in how the vehicle ran at high speed. At lower RPMs, not much difference was noticed. Eventually, he decided that it was more trouble than it was worth (he kept forgetting to fill the little water container) so he yanked the system out again.

I understand that this is not exactly "on topic". It's just a side-note I thought I'd throw in.

Did anyone do any informed and qualified research on those magnets round
the fuel pipe (at ?60)?

I read the instructions. IF you followed the instructions you would get
better mileage WITHOUT any magnets nor anything else. Assuming most
people drive uneconomically, which all males under 45 in Edinburgh do
for a start.

Hard to believe, but Scots (and maybe others) pay good money on fuel to
heat their brake linings, whilst keeping their place in the commuter
hatch.

Hey, I want in on this deal. I can always use a fast $1000.

The stock factory 350 Chevy small block (1998 Z-28 spec)
achieves a brake thermal efficiency of 38.4% by actual test
cell measurement (SAE measure). Brake thermal efficiency
is the ratio of shaft output energy on a dyno brake to the energy
contained in its fuel (18,000 BTU per pound).

The absolute Carnot cycle limit efficiency for this engine
(assuming no breathing restrictions or mechanical losses
or combustion inefficiencies, which are, of course, impossible
to achieve in practice) is 57.4%. This is the engine's so-called
Air Standard Efficiency. So the stock engine delivers 67% of
the theoretically possible efficiency in converting its fuel's
energy to shaft output energy. And so any claim that efficiency
can be improved more than 33% is bogus on its face.

If the GEET device could actually do what it claims, IE improve
the brake thermal efficiency of the small block Chevy engine by
300%. The engine's brake thermal efficiency would be 201% of
the theoretically possible Carnot cycle limit, thus violating the
basic laws of themodynamics. And it would represent 115.2% of
the total input energy contained in the fuel, which would make it
an over-unity perpetual motion machine.

Since I have faith in the laws of thermodynamics, and I believe
a perpetual motion machine is impossible, I have no doubt that
I can collect an easy $1,000 here.

1316. DCD problem - KAM and TINT 2 with MFJ Data Xcvrs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-12 00:00:00 UTC
From: ellis@stcloudstate.edu
Message-ID: <6e9borlup1@Urvile.MSUS.EDU>
Source record: 24936

I am attempting to use a KAM and a TINY 2 modem with a pair of MFJ packet data radios. The radios have no squelch so they need to work the DCD (Data Carrier Detect) capabilities of the modems. The KAM (not KAM PLUS) and the TINY 2 seem to have DCD circuitry, but its not clear how to implement the open squelch operation required by the data radios. Is there some way to do this that I am not seeing or am I out of luck?

Thanks for any suggestions. I hope this is not a FAQ.

You could always run sstvfax under dosemu via the soundmodem, you can
setup hdimage on your linux disk to do that, the hdimage can be any size
you like, it will only occupy the space of the dos programs you install.

The Chevy 350 is an even nicer motor than I always played it up to be ... as you know I don't doubt your numbers at all, however, where in the world do you get the effeciency numbers? I have a few other motors to look up. This would have been useful for my posts.

I'm not familiar with the KAM, but if it uses a TCM3105 modem chip, the same comments will apply as for the Tiny-2. These chips were designed for wire line use, and will typically interpret noise from a radio as if it were a signal, causing the DCD to be triggered at all times. Using a squelched radio will prevent this at the cost of slight time delays. A better way would be to add a state machine DCD circuit. TAPR (www.tapr.org) and PacComm have suitable circuits available for $15-25 or so.

Bruce,
I don't know about the Tiny 2 but the command on the Kam for running the
radio with open squelch is "CD software" or just "CD s". Of course omit the
quote marks.
Hope this helps

Read the www.geet.com "testimonial". You can tell its a fluke. But thanks for the incompetent insult anyway. Gary even brought you the math, I guess because of the 100HZ music transmitter type mindset, you can easily imagine whatever you want. I'll even offer to run the simulation on my machine of your radio, as long as you draw the circuit and compile it into a netnode list, along with all needed models of devices (standard of course).

>All the other answers I have read sound like the stuff I got when I said I had
>made a radio that had transmitted music on a 100 Hz bandspread.

Another good one. Ever heard of the Fourier Transform? Try it sometime. Reread my offer.

In his case, no one understood the physics at the time, and even more than that, the "established base" wasn't open to anything even logically presented because at the time, the best place to be was on a board or academic position. Comfortably I may add. How else could you explain the overlooking of real proof that audio amplification provides?

On the other hand, the fuel processor is a thing much different. There isn't a lick of proof whatsoever. The proof presented so far has been here say by a visit to a "installation", then a grand excuse of why the car so equipped couldn't make it to the demo, and measurements taken from equipment that was neither tested for calibration, accuracy, or tampering. And further, enough tests were not performed. Get real, no dyno test. The control system for this device is non-existant. How does it adapt to the engine needs, tell me? And finally, after failing proof tests of validity by measurement, it fails the laws of physics miserably. Maybe physics could be rewritten if all the true proof tests were passed, but it couldn't even do that. So there, I am thinking, you are accepting an opinion of an uninformed and ill equipped observer, and for some reasons the same instincts that for some reason tell you that you can build an AM radio that transmits music in 100HZ bandwidth or less take over and prevent you from thinking by giving you a headache.

Now, please, trully start thinking!

> The court agreed with the arguments by the supposed authorities of the day,
> who hadn't assayed the subject, but had just read it and decided it didn't work.
>

Engineering is engineering. The guy is either creating a nuclear reaction or its bogus. You can't extract more chemical energy where there is none, and a fine mist of water would never increase engine effecieny greatly, it only modifys the temperature of the intake air flow, therefore modifying possible timing curves and boost delivery curves on turbo motors, and even further down the line, allows more fuel to be injected into the engine. Its detonation elimination effect is about the only true effeciency improvement that it garners, because with less det., you can run more agressive timing, improving the use of your fuel.

>

I'm sorry, but that guy has not thought a bit, nor has the president of GEET, nor has the guy who built the thing, except for turning a profit from people who aren't engineers. And finally, neither have you. I don't deny that inventors can come up with some impressive stuff, but the fuel processor is not one of them. And looking at your homepage, you have alot of bogus stuff also. If your idea is so impressive about the pulse engine, try it on a supercomputer. I'm sure someone can throw away the money for you to try it, if your proposal was well worded. Heck time is so cheap now, it really doesn't have to be That reasonable. These simulations are completely impartial, applying only the laws of physics that seem to apply to every other thing on the planet. Would you maintain that there is a better laws of physics? Then that could be tested too. Establish them, program a new simulator, then simulate your engine. Then plug in a real everyday engine. The fact that the real engine no longer runs should prove enough to you.

1327. Got a Kantronics KTU???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-03-13 00:00:00 UTC
From: Doctor Bob <bob@antispam.com>
Message-ID: <eLHtzDALeHC1EwPi@bobshack.demon.co.uk>

Hi All.

Can anyone help please?
I've just bought a (New, discounted) Kantronics KTU Weathernode, but it
didn't come with the manual.

I 'may' get one from the vendor, but may not :-(

Thing is this, I can get it to talk to my computer, and my KAM on bypass
but how do I get it to talk to my 'Node' so that it gives out the
weather info when asked for?

It collects the data and displays it with the 'DATA TF' and 'DATA TP'
commands using 'local' mode, but that is all.

ANY help will be appreciated indeed.

Sensible advice, if followed with EXPERIMENTAL investigation.
I have read this whole off-topic thread, because it would make a hell of a
power-boost for field day and the more serious scenarios that we train for,
but in reading this thread, I have seen NOT ONE SENSIBLE answer
outside your post.

All the other answers I have read sound like the stuff I got when I said I had
made a radio that had transmitted music on a 100 Hz bandspread.

It sounds also like the injunction argument that broke Lee DeForest.
You may remember reading about him. He claimed to have invented
a thing (he called it an AUDION) which could amplify audio.

The court agreed with the arguments by the supposed authorities of the day,
who hadn't assayed the subject, but had just read it and decided it didn't work.

We call the Audion tube (valve) a Triode, today.
All CRT tubes on TVs and PCs are descended from the man who was ordered
by the court to stop selling AUDION bottles.

You sound like you are trying to join the few who do think, and I commend
you for it.

Me, I always get a headache when I try to think.

That may be why I can't sell my inventions. See my URL.

Good luck

>would have been useful for my posts.

The Z-28 numbers come from actual measurements in a test cell (dyno).
We were baselining the engine for a showroom stock class car. Air
Standard Efficiency can be calculated using formulas in "The Design
and Tuning of Competition Engines" by Philip H. Smith. The energy
content of fuels can be obtained from the CRC Handbook of Chemistry
and Physics. Drag calculation formulas are in the Bosch Automotive
Handbook (which also has the fuels data, and Cd numbers for a cross
section of vehicle bodies).

The Otto cycle engine powered auto has been around for a century. It is
a mature technology. There is plenty of engineering data available for it.
Unfortunately, wild claims like those being made by GEET have also been
around for nearly a century. And they have remained claims, because they
are not based on reality. They are either outright fraudulent scams, or the
work of some enthusiastic amateur inventor who doesn't understand
thermodynamics or how to do careful quantitative measurements.

Yeah, OK - I'll rush right out and get a 9600bps so I can be the
only one in the area to own one. I won't be able to connect to
any stations, but at least I can be "cool" and impress everyone
with my leading-edge technology, high-speed modem like you do.

Hey, wait a minute! I just had an idea! It would be really fun
during a public service function to carve up my friends new rig
so I can tap into the disc. and modulator to run 9600bps. That
would be WAY better than a simple mic/speaker connection and get
him on the air quickly and easily.

I guess you're right - there IS no place for 1200bps anymore. Maybe
I'll get rid of all my test equipment and become an appliance
operator with the latest whiz-box, so I can tell everyone what
a great and knowledgeable Ham I am.

Thanks for setting me straight Rob!

Alan, VE3NNM

I was able to find a listing for the 73M223 modem chip in the 1995
Silicon Systems databook, so it was still current then. I remember
reading in one of the newsletters I get that "Sili Systems" had
part of their company purchased by Texas Instruments. No word on
what happened to the other part, or if TI is still supporting
production. Since they couldn't wait to kill their '3105, I'm not
optimistic.

It looks like a pretty good candidate - if it can be found.
Here's some specs:

-accepts serial, asynchronous data.
-CCIT V.23 signal freqs. of 1302 and 2097 Hz.
-Uses 3.1872 MHz XTAL.
-switched capacitor, four pole butterworth filter. Can be engaged
or disengaged by state of pin 5. HI=FIL.
-16 pin DIP.

The manual states that the baud rate and mark/space tones can be
altered by changing the XTAL freq. I remember doing some math to
see if it could be used as a 300baud replacement for the AM7910
HF modem chop. BAUD=XTAL/2656; LOGIC HI tone=XTAL/2448;
LOGIC LO tone=XTAL/1520. Wound up with 325.49 Hz and 524.21 Hz
for 300 baud <sigh>.

>Tulsa OK, USA
I'll go check it out.
PS. Gary, I made my 1000 buck offer in good faith to only one person and if you flash back you'll see that it was on the condition he go see a GEET processor in operation with his own eyes fitted to a internal combustion engine, one of the GEET 5kw generators will also be included in the offer, and yes, I'll let you put a full 5kw load on it then connect it up to the dyno.
Go see it in the flesh, then come back and make us laugh.

Phil G4ZOW

PS. I'll leave with a nice anecdote:
When cold fusion can produce_reproduceable_ results seen by many researchers, then it will be accepted, just like plate tectonics and the existance of meteors.
But not until then.

Don't think I'll be spending 1000 dollars this week.

Or they might fall into the category of the FISH (sp?) carburetor. Many of the
people who tried to get one back when had their orders returned by the USPO
marked "fraudlent". My father got such a reply.

The brother-in-law of Fireball Roberts worked in a machine shop in Fla, and
would show anyone that wanted to see it, how he had a Fish and an Offie carbs
on his car.

He said Fireball had had 2 fishes on his racer but they were stolen, so he came
and traded SuperChristian an Offie for one of his.
I learned of this from when I said that the "suppressed invention" myths were
just that. I offered the Fish Carb as an example. The overweight guy at a
machine said that the existed and told the story.
I asked another guy if the fat bou knew what he was talking about.
"He should," was the reply, "he's Fireball Robert's Brother-In-Law."
The man said he had seen the Fish carbs in the Bonneville that the Bro-in-Law
drove.

But we all know that hose suppression stories are just myths.
Read a history of Brig Gen David Sarnoff, who was as bad a robber baron as
any that ever fortified a hill in medieval Europe.

The Fish Carb can be found in the Patent Office doc's.
It's a boiloff tech.

The HEI, or High Energy Ignition, I think i've already said on this thread, was
another thing like GEET when it came out. Now you buy a new car, and it is
there already. The HEI was being sold in fairs and carnivals, For God's Sake,
to try to recover the money the guy had in patenting it.

Back to GEET: People, try to keep an open mind. Investigate for yourself.

Almost every breakthrough in history had been Poo-Poo-ed by people who
later said they were some of the first to recognize the wonderful new thing.

Read the history of OTTO, who started the whole thing. Same story.
Read the stuff at my URL. Same-oh, Same-oh.

Sheesh.

WILD ! ! HOW CAN I PASS UP SUCH A GENEROUS OFFER ? ?
Easily. If I put years into something, I want something out of it.
My ego does not require your approval, but if you want to come to Tulsa and
work on it with me, after signing suitable protective documents and then
help me get the financing to build and patent and prove and sue the sox offa
the thieves, then,
COME ON ! !

One of the hallmarks of any prolific inventor is paranoia. It is a result of
bitter experience. I have had several inventions stolen from me.

I got better sense now.

I'll try, I really will. I promise, even if it gives me a headache, like it
always does. Meantime, you might like to look up Fred Teal's brother, Gene, who
is a lot like me, but he did his thing with rejetting a carb, so lean you
wouldn't think it would run, and took it to ffairs and all he got was people
trying to steal it from him. There is an annual inventors fair, in some place
like Lenora or Lenexa Kansas, way out west of the state. He was there several
years running. His brother Fred has/had a farm in that area, why I mentioned
him. You might find him on the net, even.

Then laws of fizzix is revised all the time. Sheesh.
Inventors are doing stuff all the time, which later gets first derided and then
applauded by authorities.

Hell, man, I have enuff computers around here to run failure predictions on,
but all that means to an inventor is that there ain't enuff math in the model.
That don't need a Cray. It needs math the Cray ain't got neether, by gar.

I am reminded of the thing a sailor kinfolk told my mom, for her to put in the
book she never finished. They had a huge thump on deck once during WW2,
and huge thumps tehn were very suspect, so lotsa people including the captain,
went running to see. The boat was in harbor at the time.

There were potatoes all over teh deck.
There had been an argument whether one could dive off the masthaed,
and they decided to do it scientifically first, and throw the sack of potatoes.

The captain said that would happen to anyone who tried it. He called for the
sailor who thought it up, and was told the man was being fished out of
the water even at that time, because he didn't believe in that scientific stuff.

Bogus, like many other things, is in the mind of the Bogee.
The assay test beats theeeries every time.
Sheesh.

when someone comes up with a high speed packet system, why do they not make it available to the ham community. is packet just not popular enough to bother or what? I've read about lots of high speed experiments, but does anybody actually USE the stuff in everyday hamming? is there anything out there that doesn't require a degree (i'm a highschool student)? I can follow instructions, and i'm not afraid to build- but even so my options seem rather limited.

It gets better, I see. No, you see, the Fourier Transform predicts exactly what happens in a circuit on a frequency chart. You feed in the numbers and the function your circuit performs, and out comes the frequencies that will exist in the output.

I'll sign a non-disclosure agreement and simulate it, for free. We have a deal? Theoretical designs even have a much greater chance of working in a electrical simulator than real life. So I'm giving you the benefit of the doubt.

> MY POINT EXACTLY.

But there is no proof of geet. I don't plan to rehash that again. Just read my previous post.

>

But it wasn't any sort of magic. It was still a carb. A fuel injection system can be programmed to run a car at the very edge, probably alot leaner than your friends carb, but what would be the point? No power equals no use, and thats exactly what you get when running lean.

> One of us needs to think, one of us really do, I swear.

A motor can't run water because it improves gas exit or entry of the engine. There is the energy content factor, that you seem to overlook. What about otto cycle maximum effeciency presented by Gary? Even if you had external pumps sucking the gas from the engine, it couldn't achieve the effeciency noted by GEET engineers. Plus, anything that draws power from exhaust will inherently stall the gas flow more. Even turbos, wonderful devices they are, increase backpressure within the exhaust system. Exhaust tuning is limited to certain engine speeds, but again, it doesn't give a engine liscense to burn water.

> BETTER YET, TRY IT IN A WELDING SHOP.

Well, we are waiting ..... just make sure it fits in a standard mount so it can be hauled off an analyzed in a real test environment environment. Make everyone sign non-disclosure agreements. I am not ridiculing pulse jets, just your design.

I take it you have never seen a modern parallel computer running a modern fluid dynamics procedure. Its pretty dang accurate, actually. Modern engines that run in real life, run in these simulations, and nowadays, simulations are what the real life devices are based on. IF you rewrite the laws of physics after finding your engine works, in real life, then the previous engine designs should also work in the simulation. I think computers have changed alot since you purchased your last.

Hi Lou,
I tried dialling up your homepage to no avail, I'll try again.
You, and any other interested, read that as open minded, parties may
want to check out possibly the best of the independant GEET sites @:
www.friend.ly.net/GEET/
There's a fair bit of interesting reading so I suggest you download and
read offline. Click on the 'Famous inventions' link as well, this really
backs up what Lou has just pointed out about every uninformed persons
knocking the poor inventor without bothering to do their own independant
research.
>>The Otto cycle engine powered auto has been around for a century. It is
>>a mature technology. There is plenty of engineering data available for it.
>>Unfortunately, wild claims like those being made by GEET have also been

Another Geet page to back up someone else's Geet page? I'm convinced now! (heh.)

Back in 1986, WA4DSY published the design of his 56 kb RF modem in
the Computer Networking Conference Proceedings. GRAPES sold kits
of this design for 8 years. PacComm now sells a newer version of the
design W&T. Several thousand amateurs have bought a kit or wired
unit. GRAPES uses them for its network trunks and supports two high
speed repeater based user LANs. It is in use in other areas around the
world as well (foreign sales have exceeded US sales).

Now 56 kb is no longer considered "fast", but I don't believe that there
is anything faster being offered to amateurs as a kit or W&T unit. There
is the Slovenian modem. It operates at 1.2 Mb. It is detailed on their
webpages with schematics and board layouts. But I don't think a kit
is available. AFAIK Glenn Elmore has published a 230 kb design, but
again no kit or W&T units are available. There's also a design to use
Gunnplexers at high speeds. I believe bare boards are available for
that.

The problem with high speed seems to be that you can't just go buy
one. You have to get a group together in your area to all buy the units
so that you have someone else with which to link. This requires a level
of organization and cooperation which is unfortunately rare in amateur
radio.

DX-World-Guide 1998 by DJ9ZB

Now available!

10 Years after the first edition we proudly present

now the completly new edition of Franz Langner's, DJ9ZB,

DX-World-Guide. (English language!)

This A-4 sized book is a must for DXers, SWLs, expeditoners etc.

354 pages full of information with maps, QSLs, QSL-bureaus,

Information about IOTA-Nrs, WAZ, ITU-Zones, Grid-Squares,

UTC, Prefixes, ex-Prefixes, Radioclubs for each DXCC-country!

Also many information (Address, Tel., Fax) about licensing authorities.

Each DXCC Country is presented on one page.

Price: DM 30,- incl. p&p within Europe. (Euroceque or cash)

DM 40,- or USD 25,- incl. airmail Postage worldwide (cash only)

The book is available ONLY from the publisher:

DL8HCZ, Joe Kraft, Gruetzmuehlenweg 23, D-22339 Hamburg, Germany

For any further questions: FUNK-TELEGRAMM@t-online.de

Many greetings from Hamburg de Joe, DL8HCZ

I have some Hayes Smart Modem 1200's laying around. I hate to ask a dumb question but is there any use for them in ham radio?

73.

>Phil G4ZOW

I tell you what, Phil, bring your new Camaro by the shop and we'll
pull the engine and put it on the dyno and do a baseline run to determine
stock brake thermal efficiency. Then go get your GEET processor fitted
and bring it back. We'll pull the engine again and run it on the dyno. If
the brake thermal efficiency is 3 times greater as GEET is claiming,
I'll eat all testing costs. If it isn't, you pay me for all testing costs. And
if you don't trust my testing facility, I can arrange to have it tested at
any of several top NASCAR or NHRA engine builders' facilities instead.

I'm not worried that I'll be eating any testing costs. I'd love to put the
kabosh on these scamsters before they get a chance to bilk more
money out of the gullible public.

Fascinating, where are they successfully being employed?

I've found that successful inventors generally have large numbers of
products on the market. They aren't paranoid about having an idea stolen
because they seldom have the time to develop them all before the market
niche they fill passes them by. Time to market is the name of the game.
That's why most products are marked "Patent Pending", if anyone bothers
to patent them at all.

OTOH unsuccessful inventor wannabes are almost invariably paranoid.
They think the world is out to steal their ideas. They must be, because
people aren't *buying* their ideas. The unsuccessful inventor never seems
to realize that there's a *reason* why people aren't buying their ideas.

>don't exist yet, where they gonna come from? Experimental Data, thet's where.

And I have just the spectrum analyzers to gather it, as does any reasonably
equipped radio shop. It is simple enough to prove your claims. You can even

keep your boxes sealed for all I care. All I need is to be able to sample the signal being sent between transmitter and receiver in order to measure its bandwidth. If it is passing full fidelity music in realtime, the bandwidth will be greater than 100 Hz, or the required SNR will be so unreasonably high that it will be of no practical use. Shannon's capacity bound won't be denied.

Shannon's capacity bound is C=B*ln(1+S/N). Transposed to solve for required S/N it is S/N=exp(C/B)-1. Substituting in a bandwidth B of 100 Hz and a required capacity of C=44,000 (Nyquist limit for CD quality music), the required SNR in db is 1911 db. Even if we'll accept speech quality (C=5000) audio, the required SNR for a 100 Hz bandwidth is 434.3 db. That's totally useless, and a far cry from the 19.5 db SNR required for CD quality music in a 10 kHz bandwidth, or the 1.16 db SNR required in a 165 kHz bandwidth. (Of course these are theoretical bests, in practice we can't achieve CD quality with transmission link SNRs that low, and neither can you.)

I expect you've fallen into the same trap that Petit did when he first published his Clover system in 73 Magazine. He claimed a 2 Hz bandwidth. The actual bandwidth is 500 Hz. The problem was his spectrum analyzer didn't catch the sidebands because they were below its noise floor, but not below the noise floor of the Clover receiver in his test setup.

Common spectrum analyzers have a noise floor of -80 dbm to -100 dbm while most receivers have a noise floor of -120 dbm to -140 dbm. So a faulty test setup led him to claim theoretically impossible results. When it was measured more carefully with a signal level that was above the spectrum analyzer noise floor, the truth came out. Clover is good, but it isn't better than theoretically possible good. And neither is anything else, not your music system, and not the GEET processor.

In fact they have to. Rewriting physical law can't negate any previous
observable. If it does, then your rewrite is incorrect. New theories
can't negate any of the observable results of prior theory. When
Einstein's theory displaced Newton's theory, apples still fall from
apple trees.

Hey guys and gals I found a really cool site that sells plaques.
they make it using a copy of your FCC license. Very nice plaques
high quality. you can check it out a link is on my ham radio page.
or go directly there at
http://www.awards-r-us.com/wireless/products.cfm?siteid=3121
or my page at http://www.flinet.com/~duane/ham/ham.html

PC PakRatt for Windows is a product of Timewave of Timewave Tecnhology Inc.
This is the official terminal program for Timewave and AEA TNCs and multimode
data controllers. It is available from Timewave's worldwide dealer and
distributor network. A list of the dealers and distributors is on Timewave
website.

Timewave's addresses are:

www.timewave.com
sales@timewave.com
voice telephone 612-452-5939
FAX 612-452-4571

Timewave has moved its facilities effective March 9, 1998.
The new mailing/shipping address is:
Timewave Technology Inc.
1301 Corporate Center Drive, Suite 140
St. Paul, MN 55121 USA

Please note the phone numbers remain unchanged.

Yes, interfacing difficulties associated with the higher speeds and the fact that most Hams find 1200bps adequate for the simple text-based messages they exchange have hindered high-speed development in many areas.

But I think an additional reason is the elitist attitude that was reflected in Rob's arrogant response to Luis' request for assistance and my response. Why imagine, if Rob hadn't been dismissive towards Luis' work at 1200bps, it might actually have left a good impression that would encourage him to look at the higher speeds someday. Instead, he showed the all-to-common attitude that those who run the later technology show. - Still using THAT type of modem... You've got a WHAT for a computer <snicker>... etc. etc. I've always felt that if you can't be constructive and supportive of someones to learn and experiment, then shut the hell up.
